**Scheme. S1.** Synthesis mechanism of the pyrene based cysteine selective chemodosimeter (CCD).

**Fig. S1.** (A) UV-vis and (B) fluorescence spectra of CCD2 (5.0 μM) in aqueous solution (10 mM PBS buffer, pH 7.4, 10% DMSO) upon addition of Cys (100 equiv). Excitation at 343 nm after 10 min (slit=1.5/3).
Fig. S2. (A) C 1s spectrum, (B) O 1s spectrum, and (C) N 1s spectrum of XPS analysis obtained in CCD1 functionalized swCNTs.
Fig. S3. The optimization of detection conditions. Effects of (A) the pH of the reaction solution and (B) the incubation time for CCD1 immobilization on the CNT-FET conductance response. The injected Cys concentration was 10 μM, and the 0.1 V was applied to CCD1-modified CNT-FETs for conductance measurement.
Fig. S4. Real-time conductance measurement data obtained from CCD2-modified CNT-FETs upon successive addition of Cys at various concentrations. Arrows indicate the injection points of Cys target molecules.
