## Materials

Zinc oxide was purchased from Sigma Aldrich Co., Ltd. 1,2,4-triazole,  $\text{Co}(\text{CH}_3\text{COO})_2 \cdot 4\text{H}_2\text{O}$ ,  $\text{Mn}(\text{CH}_3\text{COO})_2 \cdot 4\text{H}_2\text{O}$ , phosphoric acid and ethanol were purchased from Wako Pure Chemical Industries Co., Ltd. All reagent was reagent grade and used without further purification.

## Synthesis

Powder sample of  $[\text{M}(\text{H}_2\text{PO}_4)_2(\text{TrH})_2]$  (ZnTr, CoTr, MnTr) were synthesized as reported previously.<sup>1</sup> As a typical procedure for ZnTr, ZnO (1 mmol, 81 mg) and phosphoric acid (85% in  $\text{H}_2\text{O}$ , 2 mmol, 136  $\mu\text{L}$ ) and 1,2,4-triazole (2 mmol, 138 mg) are put into a 10 mL Teflon jar with two Teflon balls with 10 mm diameter. The mixture was ground for 60 min in a Retch MM200 mixer mill at 25 Hz. The obtained white powder was washed with ethanol and dried at 80 °C for 15 h. The purity of each compound was checked by powder X-ray diffraction and Thermal gravimetric analysis (Figure S1). ICP-AES were used to determine the content of metal and phosphorous by SII NanoTechnology SPS-5100.

## Conductivity measurement

AC impedance spectroscopy were carried out to determine the ion conductivity. Measurements were performed using impedance and gain-phase analyser (Solartron SI 1287/1255B) over frequency range 0.1 Hz to 1 MHz with an input voltage amplitude of 50 mV. Sample powders were pressed at 500 kg N for 2 minutes and sandwiched between carbon electrodes with 10 mm diameter, which were set into measurement cell that was filled with  $\text{N}_2$  at 0.1 MPa. ZView software was used to fit impedance data sets by means of an equivalent circuit simulation to obtain the resistance values.

## Spectroscopy

The infrared experiment (1,000-4,000  $\text{cm}^{-1}$ ) was performed by a Fourier-transform spectrometer (FT-IR 6100LT, JASCO) equipped with a Cassegrain microscope (IRT-5000, JASCO). The aperture size was fixed to be  $100 \times 100 \mu\text{m}^2$ , and the resolution was 4  $\text{cm}^{-1}$ . Spectra were obtained at 27 °C for the samples mounted on an optical cryostat (ST-500, Cryogenic). The absorbance spectra in 40-110  $\text{cm}^{-1}$  were obtained at 27-107 °C with a terahertz time-domain spectrometer (RT-20000, Tochigi Nikon). Time evolutions of transmitting electric field were measured for both the cases with and without the sample mounted on an aperture of optical cryostat. Each time evolution was converted into an intensity spectrum by Fourier transform. The difference between those intensity spectra provides the absorbance spectrum due to the sample.

## Computational details

Total energies were computed from ab-initio quantum mechanical calculation within density functional theory (DFT) as implemented in VASP code (VASP 5.2).<sup>2</sup> We used the generalized gradient approximation by Perdew, Burke, and Ernzerhof for the exchange correlation energy<sup>3</sup>. The core electrons are handled in the projector augmented wave (PAW) method,<sup>4</sup> and valence electrons (H:1s<sup>1</sup>, C:2s<sup>2</sup>2p<sup>2</sup>, O:2s<sup>2</sup>2p<sup>4</sup>, N:2s<sup>2</sup>2p<sup>5</sup>, P:3s<sup>2</sup>3p<sup>5</sup>, Zn:3d<sup>10</sup>4s<sup>2</sup>, Co:3p<sup>6</sup>3d<sup>8</sup>4s<sup>1</sup>, Mn:3p<sup>6</sup>3d<sup>6</sup>4s<sup>1</sup>) are represented with

wave functions based on plane waves. Energy cutoff for the plane-waves was set at 520 eV. The Monkhorst-Pack scheme with  $4\times4\times2$   $k$ -points and total energy convergence of  $0.8\times10^{-6}$  eV per atoms were used. We performed optimization of the cell parameters and atomic positions. Spin-polarized calculations were executed for CoTr and MnTr in the structural relaxation, whereas spin-nonpolarized calculations were adopted for ZnTr. All atomic forces were reduced lower than  $5\text{ meV \AA}^{-1}$ . Table S4 lists the optimized cell parameters and structures of each model, and the optimized cell parameters of each model were in agreement to within 2.5% in the experimental data (Table S1). Vibrational calculations were carried out for the optimized structures within the density functional perturbation theory (DFPT) as implemented in the VASP code. The eigenvector and eigenvalues of normal modes were calculated in the harmonic approximation at the Brillouin zone center. All DFPT calculations were performed in spin-nonpolarized DFT approach, even though CoTr and MnTr are open-shell systems. We checked the validity of the vibrational spectra calculations by using the  $\text{Co}(\text{H}_2\text{PO}_4)_2(\text{TrH})_4$  cluster models which were relaxed by the spin-polarized and spin-nonpolarized calculation, respectively. As shown in Figure S4, there were no significant difference in the vibrational frequencies between them.

**Table S1.** X-ray crystallographic data and distance of hydrogen bonds (O(H)–O) for ZnTr, CoTr, and MnTr.

**Figure S2.** Temperature dependence of the vibrational line width in terahertz time domain spectra. (a) Temperature dependence of full width at half maximum (FWHM) of the 77  $\text{cm}^{-1}$  (filled circle) including the  $T^a$  and  $T^b$  modes and 63  $\text{cm}^{-1}$  (filled square) corresponding to the *R* mode in ZnTr. (b) Temperature dependence of FWHM of the 96  $\text{cm}^{-1}$  (open square) corresponding to the *R* mode and 63  $\text{cm}^{-1}$  (open circle) corresponding to the  $T^c$  mode in CoTr. The bands were fit with Lorentzian function to determine the FWHM. The vertical axis indicates the difference of FWHM with respect to the value at 300 K.

**Figure S3.** Partial Density of States (PDOS) of  $\text{Zn}^{2+}$  in ZnTr. Total and  $d$ -orbital density are shown with black and red line, respectively. The Fermi level is set at zero energy.

**Figure S4.** Comparison of vibrational wavenumbers between spin-restricted and spin-unrestricted DFT calculation. Calculations were performed for the cluster model of  $\text{Co}(\text{H}_2\text{PO}_4)_2(\text{TrH})_4$ . The structure was cut from the periodic crystal structure of CoTr and then relaxed with the corresponding calculations. (a) All frequency region and (b) partially enlarged terahertz region ( $< 10$  THz).

**Table S4.** Optimized cell parameters and structures of ZnTr, CoTr, and MnTr.
