**Fig. S1** The layered structure of bentonite clay. (a) Schematic illustration of the crystal structure of the bentonite clay. (b) The XRD patterns of the bentonite clay. (c) SEM image of the bentonite clay. The lattice structure of bentonite clay consists of ~1 nm thin layers with an octahedral layer of Al-O unit sandwiched between two tetrahedral layers of Si-O units.
Fig. S2 Ion models for a) EMIM$^+$ and b) BF$_4^-$.
Fig. S3 EDS images of the bentonite after self-discharge process.
Fig. S4 The Contact Angle test of the solid film produced. (a) Water and (b) ionic liquid.
Fig. S5 The DSC curves of the EMIMBF$_4$, bentonite clay and the BISE. The weight loss of ionic liquid is mainly due to the volatilization of trace impurities and the decomposition and carbonization of ionic liquid. The weight loss of bentonite clay is mainly due to the evaporation of water adsorbed on the surface and between layers, and the decomposition of bentonite clay.
Fig. S6 The calculation of the ionic conductivity.

\[
\sigma = \frac{d}{R \times S}
\]

\(d\) (cm) — the thickness of the conductor;

\(R\) (Ω) — the conductor resistance;

\(S\) (cm\(^2\)) — the cross-sectional area of the conductor.
Fig. S7 EIS spectra of the BISE electrolyte at (a) 25 °C, (b) 50 °C and (c) 75 °C.
Fig. S8 SEM images of the BISE. (a) Before the self-discharge, (b) after the self-discharge.
**Fig. S9** The self-discharge of different electrode materials. (a) Decay of open circuit potential for the AC based supercapacitor and hCTNs based supercapacitor. (b) The corresponding pore size distributions of the AC and hCTNs calculated by density functional theory. SEM images of the (c) AC and (d) hCTNs.
Fig. S10 Open circuit potential decays for conventional supercapacitors and BISE solid-state supercapacitors. BISE-based supercapacitors show a very low self-discharge rate of only 35.9% after 24 h. In contrast, the open circuit potential of the conventional supercapacitors with cellulose membrane dropped by 70.3%. Therefore, this BISE can not only reduce the self-discharge of supercapacitors with ionic liquid electrolyte, but also reduce the self-discharge of supercapacitors with commercial organic electrolyte.
Fig. S11 Electrochemical properties of BISE-based supercapacitors in different temperatures. (a) Typical CV curves of BISE-based supercapacitors in different temperatures at a scan rate of 5 mV s$^{-1}$. (b) GCD curves of BISE-based supercapacitors in different temperatures at a current density of 0.5 mA cm$^{-2}$. (c) Nyquist plots. (d) The areal capacitance values at different current densities.
### Supplementary Table

Table. S1 The comparison of BISE-based supercapacitors with most other reported supercapacitors.
