Crystal Syntheses and Characterization

Ag(CF$_3$COO)(DABCO) 1: Ag(CF$_3$COO) (28.0 mg, 0.127 mmol) in ethanol (4 mL) was added to DABCO (14.2 mg, 0.127 mmol) in ethanol (4 mL). White powder formed rapidly and was redissolved upon addition of 0.9M aqueous NH$_3$ (4 mL). Colorless crystals of 1 (13.5 mg, yield 32.0 %) resulted after 18 days. Partial decomposition (Ag(I) reduction) prevented satisfactory elemental and powder diffraction analysis.

Ag(CF$_3$COO)(TMP) 2*: Ag(CF$_3$COO) (35.2 mg, 0.159 mmol) in ethanol (4 mL) was added to tetramethylpyrazine (TMP) (21.7 mg, 0.159 mmol) in toluene (4 mL). Colorless crystals of 2 (41.2 mg, yield 72.4 %) resulted after 7 days. Calcd: C, 33.64; H, 3.39; N, 7.85%; found: C, 33.73; H, 3.43 N, 7.57%. Ag(CF$_3$COO)(pyraz) 3*: Ag(CF$_3$COO) (34.0 mg, 0.154 mmol) in ethanol (4 mL) was added to pyrazine (12.2 mg, 0.153 mmol) in ethanol (6 mL). Colorless crystals of 3 (28.6 mg, yield 61.9 %) resulted after 11 days. Calcd: C, 23.94; H, 1.34; N, 9.31%; found: C, 24.07; H, 1.35 N, 9.11%. Crystals were grown by slow evaporation at ca. 22 ºC. *Powder diffraction patterns (bulk samples) consistent with calculated patterns.
