Mesomorphic Phenanthroline Derivatives: Novel Architectures based on Hydrogen Bonding

Guillaume Pickaert, Laurent Douce, Raymond Ziessel, and Daniel Guillon

Supporting Information

Figure S1. FT-IR spectra (from 1400 to 1750 cm⁻¹), recorded for compound L₁₂ versus the temperature from 40 to 160°C. The measurements were carried out polished KBr disks starting from the crystalline to the isotropic phase.

Figure S2. FT-IR spectra (from 1400 to 1750 cm⁻¹), recorded for compound 1₁⁶ versus the temperature from 40 to 160°C. The measurements were carried out polished KBr disks starting from the crystalline to the isotropic phase under the same condition as for Figure S1.

Figure S3. X-ray diffraction pattern of the palladium complex of ligand L₁⁶ at 70 °C and schematic representation of the packing in the smectic mesophase (Insert).
