Supplementary Information

**Pd•Et₂B-Catalyzed Alkylation of Amines with Allylic Alcohols**

Masanari Kimura, Makoto Futamata, Kazufumi Shibata, and Yoshinao Tamaru

Department of Applied Chemistry, Faculty of Engineering, Nagasaki University, 1-14 Bunkyo-machi, Nagasaki 852-8521, Japan

masanari@net.nagasaki-u.ac.jp

**General**: Pd salts [Pd(PPh₃)₄, Pd(OAc)₂] and triethylborane (1.0 M solution in hexanes), were purchased and used without further purification. Tetrahydrofuran was distilled from a blue solution of sodium benzophenone ketyl under N₂ immediately prior to use. *cis*-5-Methoxycarbonylcyclohexen-3-ol (2) was prepared according to the literature.¹

**Standard Experimental Procedure** (run 2, Table 1): Into a N₂ purged flask containing Pd(PPh₃)₄ (0.05 mmol), were added successively THF (5 mL), allyl alcohol (1.2 mmol), N-methylaniline (1.0 mmol), and Et₃B (0.3 mmol, 1 M in hexane) via syringe. The reaction mixture was stirred at ambient temperature for 30 h, during which the reaction was monitored by means of TLC. After dilution with ethyl acetate (30 mL), the
mixture was washed with aq. NaHCO₃ and brine. The organic layer was dried (MgSO₄) and concentrated in vacuo, and the residue is purified by column chromatography over silica gel (FUJI SILYSIA NH; hexane) to provide 1a in 96% yield.

**N-2-Propenyl-N-methylaniline (1a)**
