Experimental

General Procedures

All manipulations were carried out under a dry oxygen-free nitrogen atmosphere using standard Schlenk techniques, or in a MBraun Unilab glove box, unless otherwise stated. Solvents (hexane, toluene, diethyl ether and thf) were purified by passage through activated alumina towers and degassed with nitrogen prior to use. d$_6$-Benzene was distilled from potassium and degassed by three freeze-pump-thaw cycles prior to use. Other reagents were procured from Aldrich or Strem and used without further purification. Elemental analyses were determined by Mr. Stephen Boyer at London Metropolitan University.

$^1$H and $^{13}$C NMR spectra were recorded on a Bruker AMX300 spectrometer, referenced internally to residual solvent proton resonance, and externally to TMS. Crystallographic X-ray data were collected variously using Bruker SMART 1000 or APEX CCD area detector diffractometers (MoK$_\alpha$, $\lambda$ = 0.71073 Å) using $\omega$ scans. Structure solution and refinement was carried out using the SHELXTL suite of programs.$^1$

Preparation of [LiL] 1a

$n$BuLi (3.04 ml, 7.61 mmol) was added to a cold (−78 °C) solution of HL (1.70 g, 7.61 mmol) in thf (5 ml), during which time the solution turned red. The solution was allowed to warm slowly to room temperature and stirred for 18 hours. Volatiles were removed *in vacuo* to give a sticky red solid. The product was dissolved in diethyl ether (10 ml) and stored at −30 °C overnight to afford **1a** as a crop of colourless crystals suitable for an X-ray diffraction study. Yield: (0.82 g, 80 %). Anal. Calcd for C$_{26}$H$_{48}$Li$_2$N$_6$: C, 68.10; H, 10.55; N, 18.33 %. Found C, 67.95; H, 10.75; N, 18.16 %. $^1$H NMR (300 MHz, $d_6$-benzene, 298 K): $\delta$ 1.35 (s, 18H, tBu), 1.37 (s, 18H, tBu), 3.83 (m, br, 8H, CH$_2$), 6.35 (s, 2H, CH), and 6.49 (s, 2H, CH). $^{13}$C($^1$H) NMR (75 MHz, $d_6$-benzene, 298 K): $\delta$ 31.65 (tBu), 33.12 (tBu), 52.35 (NCMe$_3$), 54.36 (CH$_2$), 55.1 (CH$_2$), 55.92 (NCMe$_3$), 115.46 (CH), 120 (CH), and 198.71 (C$_{\text{carbene}}$).

Preparation of [MgL$_2$] 2

A solution of Me$_2$Mg (0.21 g, 3.78 mmol) in THF (4 ml) was added dropwise to a cold (−78 °C) solution of LH (1.69 g, 7.57 mmol) in THF (10 ml). The solution was allowed to warm to room temperature and stirred for 18 hrs, during which time the pale yellow solution became dark orange. Volatiles were removed *in vacuo* to afford a tan coloured powder. The product was washed with diethyl ether (5 ml), and the resulting microcrystalline precipitate isolated by filtration. The mother liquor was stored at −30 °C overnight to give a crop of colourless crystals of [MgL$_2$], **2**. Combined yield: 1.29 g, 73 %. Crystals suitable for an X-ray diffraction study were grown from cold (5 °C) diethyl...
