### General remarks

Commercial reagents (Fluka, Aldrich) were used without purification. Solvents were distilled prior to use: THF from Na and benzophenone. Sulfur dioxide was dried by passing through a column filled with P$_2$O$_5$, Al$_2$O$_3$ for drying (Fluka 06400), Al$_2$O$_3$ basic activated Type 5016A Brockman I (Aldrich 19,944-3). Light petroleum ether used refers to the fraction boiling at 40-60°C. Solutions after reactions and extractions were evaporated in a rotary evaporator under reduced pressure. Liquid/solid flash chromatography (FC): columns of silica gel (0.040-0.63 mm, Merck No.9385 silica gel 60, 240-400 mesh). TLC for reaction monitoring: Merck silica gel 60F 254 plates; detection by UV light; Pancaldi reagent [(NH$_4$)$_6$MoO$_4$, Ce(SO$_4$)$_2$, H$_2$SO$_4$, H$_2$O] or KMnO$_4$. IR spectra: Perkin-Elmer-1420 spectrometer. $^1$H NMR spectra : Bruker-ARX-400 spectrometer (400 MHz); δ (H) in ppm relative to the solvent’s residual $^1$H signal [CHCl$_3$, δ (H) 7.27] as internal reference; all $^1$H assignments were confirmed by 2D-COSY-45 spectra. $^{13}$C NMR spectra : same instrument as above (100.6 MHz); δ (C) in ppm relative to solvent C-signal [CDCl$_3$, δ (C) 77.0] as internal reference; coupling constants $J$ in Hz. MS: Nermag R-10-10C, chemical ionization (NH$_3$) mode m/z (amu) [% relative base peak (100%)]. HRMS : Jeol AX-505. Elemental analyses : Ilse Beetz, D-96301 Kronach, Germany.

#### Poly(methyldienecyclopentane-sulfone) (2)$^1$

![Poly(methyldienecyclopentane-sulfone) (2)](image)

Methyldienecyclopentane (1) was purified by distillation. SO$_2$ (1.6 ml, 0.0358 mol) was transferred to frozen methyldienecyclopentane (1) (1.0 g, 12.2 mmol) on the vacuum line. Mixture was allowed to warm to –20 °C. After 2 hours, at this temperature, the excess of SO$_2$, non-reacted methyldienecyclopentene (1) and 1-methylecyclopentene was evaporated under reduced pressure (0.001 Torr). Poly(methyldienecyclopentane-sulfone) (PS) (1.3 g, 75 %) was, powdered and neutralized with aqueous solution of NaOH (0.1 N) till pH=7 and washed 3 times by turns with water and CH$_2$Cl$_2$. Neutralized polymer was dried on the vacuum line overnight.

For characterization see:

### General procedure for deprotection of a allyl ethers

In two necked flask was added allyl ether (0.1 mmol), neutralized poly(methyldienecyclopentane-sulfone) (2) (10 weight%) and 2ml of cyclohexane. Reaction mixture was refluxed under inert atmosphere and followed by TLC. After reaction was finished the liberated alcohol was purified by flash chromatography.
2-(3-Methylbut-2-en-1-yloxy)-1-phenylethanol (18)

NaH (55% in oil dispersion, 2 g, 45.8 mmol) was added to a stirred solution of 1-phenylethane-1,2-diol (17) (3.16 g, 22.9 mmol) in anhydrous DMF (40 mL) under Ar atmosphere at -40 °C. Reaction mixture was heated to -10 °C and prenyl bromide (3.41 g, 22.9 mmol) was added dropwise. Reaction was followed by TLC (CH₂Cl₂/Ethyl acetate=10/1) and, after finishing, quenched with water, extracted with CH₂Cl₂, dried over MgSO₄ and purified by flash chromatography (CH₂Cl₂/Ethyl acetate=10/1).

2-O-Prenyl-β-D-ribo-2,4-anhydro-3-deoxyhexopyranose (22c).

A mixture of isolevoglucosenone 21 (150 mg, 1.0 mmol), prenyl alcohol (300 mg, 2.3 mmol) and triethylamine (14 µL, 0.10 mmol) was stirred at 20°C for 2h. Excess of alcohol was then eliminated by evaporation in vacuo. The residue was chromatographed on silicagel (1:9 EtOAc/petroleum ether) affording a colorless syrup, which was dissolved in THF (5 mL), cooled to –78 °C. Successively the ketone was reduced by K-selectride (1 M, 1mL). The reaction mixture was allowed to warm to r.t. and stirred overnight. Then methanol and NH₄Cl were added, after stirring for 1h, the reaction mixture was filtrated over Celite and concentrated. The crude was purified by column chromatography (silica, PE:EtOAc 1:1) to obtain 22c in a yield of 75% (150 mg, 0.7 mmol)

![Figure S8. $^1$H-NMR spectrum of 2-0-methylprenyl-β-D-ribo-2,4-anhydro-3-deoxyhexopyranose (22d)](image)

4-O-Methallyl-2-O-(2-methylprenyl)-β-D-ribo-2,4-anhydro-3-deoxyhexopyranose (26d)

To a solution of 22d (150 mg, 0.6 mmol) in THF at 0 °C was added NaH (40 mg, 1 mmol) and stirred at this temperature for 1h. Afterwards methallyl bromide (0.2 mL, 0.8 mmol) was added and the reaction mixture was allowed to warm to r.t.. The reaction mixture was then heated under reflux until the reaction was completed, quenched by water and extracted with CHCl$_3$, dried and concentrated. The crude was purified by column chromatography (silica PE:EtOAc 1:4) to obtain 26d in 68% (130 mg, 0.6 mmol)
