Synthetic procedures and physical data of the polymers and monomers as well as fabrication procedures for the PLEDs are presented.
**Procedure for device fabrication and characterizations**

The electroluminescent (EL) devices were prepared on patterned indium-tin-oxide (ITO) glass with a sheet resistance of 20 Ω/□. The device configurations were ITO / PEDOT : PSS (3,4-polyethylenedioxythiophene : polystyrenesulfonate, 30 nm) / 2c (device A) or 2g (device B, 30 – 50 nm) / BCP (2,9-dimethyl-4,7-diphenyl-1,10-phenanthroline, 20 nm) / Alq₃ (tris(8-quinolinonato)aluminium, 20 nm) / LiF (0.5 nm) / Al (200 nm). PEDOT:PSS was spun onto the ITO glass using standard spin-coating method. This is followed by thermal vacuum deposition of BCP, Alq₃ and the LiF / Al electrode sequentially under a vacuum of 1 × 10⁻⁶ torr. The performance of the devices was examined using Photoresearch PR-650 in air without encapsulation. The current-voltage characteristics were studied using a Keithley 2400 sourcemeter.

**Physical characterizations of the polymers**

Positive electron impact (EI) mass spectra were obtained on a Finnigan Mat 95 mass spectrometer. ¹H and ¹³C NMR spectra were recorded on either a DRX270 or DRX300 Bruker FT-NMR spectrometers, with chemical shifts (in ppm) determined relative to tetramethylsilane. UV/Vis spectra were recorded on a PerkinElmer Lambda 900 UV/Vis spectrophotometer. Emission spectra were obtained on a SPEX Fluorolog-3 fluorescence spectrophotometer. Luminescence quantum yields were measured according to a previously reported method (L. O. Pålsson and A. P. Monkman, *Adv. Mater.* 2002, **14**, 757), with an estimated error of ±15%. The thickness of the films was measured using Vecco Dektak-3ST Surface Profilometer. The decomposition temperature was determined using a PerkinElmer TGA7 under nitrogen atmosphere with a heating rate of 20 °C / min. Atomic Force Microscopy (AFM) measurement
was performed with a Digital Instruments Nanoscope IIIA. The topographic image was obtained under ambient conditions using the tapping mode.

\textbf{Syntheses of monomers 1a – 1h}

The synthesis of 1a is described as a typical example. Other monomers were prepared in a similar manner. A solution of aniline (0.002 mol) and 5,5-methylene-\textit{bis}-salicylaldehyde (0.002 mol) in dichloromethane was refluxed for 24 hours. After cooling, the precipitate was washed with cold ethanol and dried under vacuum to give the product as a solid. Syntheses of polymers 2a – 2h

The synthesis of 2a is described as a typical example. Other polymers were prepared in a similar manner. A solution of Zn(OAc)$_2$·2H$_2$O (0.1 mmol) in DMF (5 mL) was added dropwise to another solution of salicylaldimine monomer 1a (0.1 mmol) in DMF (5 mL). The mixture was heated at 100 °C under nitrogen atmosphere for 24 hours. Upon cooling to room temperature, the resulting solution was poured into methanol. The precipitate obtained was purified by repeated precipitations using DMF and methanol. The polymer product was dried under vacuum at 80 °C for 24 hours. Yield: 79%.
