Combining sugar biosynthesis genes for the generation of L- and D-amicetose and formation of two novel antitumor tetracenomycins

María Pérez, Felipe Lombó, Lili Zhu, Miranda Gibson, Alfredo F. Braña, Jürgen Rohr, José A. Salas and Carmen Méndez *

Supporting information
**Microorganisms, culture conditions and vectors**

*Saccharopolyspora spinosa* (spinosyn producer) was used as source of DNA. pLN2, pLNr, pLNrh and pLNBI2c were used as sources of sugar DNA cassettes. *Streptomyces lividans* 16F4 was used as host for gene expression. Growth was carried out on trypticase soya broth (TSB; Oxoid) or R5A medium for product isolation. For sporulation we used agar plates containing A medium for 7 days at 30°C. *Escherichia coli* DH10B (Invitrogen) was used as a host for subcloning and was grown at 37°C in TSB medium. pCRBlunt (Invitrogen), pUC18, and pIAGO were used as vectors for subcloning experiments and DNA sequencing. When antibiotic selection of transformants was needed, 50 µg/ml of thiostrepton, 25 µg/ml of apramycin, 50 µg/ml of kanamycin, or 100 µg/ml of ampicillin were used.

**DNA manipulation and sequencing**

Plasmid DNA preparations, restriction endonuclease digestions, alkaline phosphatase treatments, ligations and other DNA manipulations were according to standard procedures for *Streptomyces* and for *E.coli*. Sequencing was performed by using the dideoxynucleotide chain-terminator method and the Thermo Sequenase Labelled Primer Cycle Sequencing Kit with 7-deaza-dGTP (Amersham Biosciences). Both DNA strands were sequenced with primers supplied in the kits or with internal oligoprimers (18-mer) using an ALF-express automatic DNA sequencer (Pharmacia). Computer-assisted data base searching and sequence analyses were carried out using the University of Wisconsin Genetics Computer Group programs package and the BLAST program.

**PCR amplification**

Primers for *spnQ* amplification, including extra XbaI sites at both extremes were: FL-Sq-up: 5’-TCTAGAAGAGACTGATCGTCGCTGTTG-3’. FL-Sq-rp: 5’-TCTAGACTAGAACTGATCGTCGCTGTTG-3’. The resulting PCR amplicon was subcloned into plasmid pCR-blunt (Invitrogen), generating pFL838. PCR reaction conditions were as follows: 100 ng of template DNA were mixed with 30 pmols of each primer and 1.25 units of Platinum-Pfx DNA Polymerase (Invitrogen) in a total reaction volume of 50 µl containing 1 mM MgSO₄, 0.3 mM of each dNTP, 1x Pfx-buffer, and in some cases PCRx Enhancer Solution. The polymerization reactions were performed in a thermocycler (PT-100, MJ Research). General conditions for PCR amplification were as follows: 2 min at 94°C; 30 cycles composed of 30 s at 94°C, 1 min at the primers annealing temperature (58°C), and 80 s at 68°C; 5 min at 68°C; and 15 min at 4°C. The PCR products were purified with GFX PCR DNA and Gel Band Purification Kit (Amersham Biosciences), subcloned into pCRBlunt and sequenced.
Production conditions and chromatographic techniques

Spores of S. lividans 16F4 containing the different constructs were grown in R5A medium according to conditions previously described.\textsuperscript{2c} HPLC analyses were performed as previously described.\textsuperscript{2c}

Mass spectra and NMR analysis

HPLC-MS analysis of the glycosylated compounds was carried out using a chromatographic equipment coupled to a ZQ4000 mass spectrometer (Waters-Micromass), using electrospray ionization in the positive mode, with a capillary voltage of 3 kV and a cone voltage of 20 V. Chromatographic conditions were as previously described,\textsuperscript{2c} except for the column size (2.1 x 150 mm) and flow rate (0.25 ml/min). A SymmetryPrep C18 column (7.8 x 300 mm, Waters) was used for compound purification, with acetonitrile and 0.1% trifluoroacetic acid as solvents. The new compounds were eluted in isocratic mode with 40%. Standards with pure compounds were used for L-olivosyl, L-digitoxosyl-, D-olivosyl-TCM and -ELM comparisons.

Isolation and physico-chemical characterization of the new amicetosyltetracenomycins

Final purification was achieved by semi-preparative HPLC. Semi-preparative HPLC was run on a Waters Delta 600 instrument with a Waters 996 photodiode array detector (Waters symmetry C\textsubscript{18} column, 19 x 150 mm, particle size 7 \textmu m; solvent system: linear gradient H\textsubscript{2}O:CH\textsubscript{3}CN 80:20 to 40:60 within 30 min, flow rate 10 ml/min). HPLC/MS was performed on a Waters Alliance 2695 system with Waters 2996 photodiode array detector and a Micromass ZQ 2000 mass spectrometer equipped with an APCI ionization probe (Waters symmetry C\textsubscript{18}, 4.6 x 50 mm, particle size 5 \textmu m; solvent system: linear gradient H\textsubscript{2}O:CH\textsubscript{3}CN = 75:25 to 30:70 within 12 min; flow rate = 0.5 mL/min).

8-Demethyl-8-b-D-amicetosyl-tetracenomycin C (1)

Yield: 10 mg; \textit{R}_{rel} = 4.15 min (analytical HPLC-MS)  
MW = 572 g/mol (C_{28}H_{28}O_{13})  
Positive mode APCI-MS (from HPLC-MS): \textit{m}/\textit{z} = 573 (10%, M+H)^+; 459 (100%, aglycon), 441 (60%), 423 (30%), 409 (45%), 346 (100%), 313 (30%).  
UV maxima (from HPLC-diode array): 250 (60%), 288 (100%), 390 (35%), 413 (35%)
NMR data of 8-Demethyl-8-β-D-amicetosyl-tetracenomycin C (1). Given are d-values in ppm relative to TMS, in $d_6$-DMSO.
