Supplementary Information

Selective electrochemical sensing of acidic organic molecules via a novel guest-to-host proton transfer reaction

H. Miyaji, G. Gasser, S. J. Green, Y. Molard, S. M. Strawbridge, J. H. R. Tucker

Synthesis of the perchlorate salt of L-Phe:
L-Phe (Aldrich, 500 mg, 3 mmol) was suspended in MeOH (10 mL). Perchloric acid solution (68%, 448 mg, 3 mmol) was then added dropwise to the stirred suspension, causing the amino acid to dissolve. The solvent was removed and benzene (30 mL) added which in turn was removed to give the product as a white solid in quantitative yield. The salt was recrystallised from CH₃CN/CHCl₃ and dried in-vacuo.

¹H NMR (CD₃CN, 300 MHz): δ 7.39 (m, Ar-H, 5H), 7.06 (s, NH₃, 3H), 4.28 (m, CH, 1H), 3.34 (dd, HCH, 1H), 3.17 (dd, HCH, 1H).

Synthesis of receptor 2:
1-chlorocarbonyl-1’-[(6-methyl-2-pyridyl)amino]carbonyl]ferrocene (50 mg, 0.13 mmol) and 2-(aminomethyl)-18-crown-6 (Aldrich, 38 mg, 0.13 mmol) were mixed together in dry THF (10 mL) containing triethylamine (13 mg, 0.13 mmol) and DMAP (1 mg). The solution was stirred under N₂ for 2 hours, after which time the solvent was removed and the resulting mixture subjected to column chromatography on silica (eluent: CHCl₃/MeOH/NH₃(aq) = 88/10/2). The largest fraction was collected and purified further by column chromatography on neutral alumina. The pure product 2 (16 mg, 19 % yield) was isolated as an orange viscous oil using the eluent mixture CH₃CN/CHCl₃/MeOH = 4/1/0.5.

¹H NMR (CD₃CN, 400 MHz): δ 8.76 (s, NH, 1H), 8.04 (d, py-H, 1H), 7.67 (tr, py-H, 1H), 6.98 (m, py-H and NH, 2H), 4.85 (s, Cp-H, 2H), 4.72 (s, Cp-H, 2H), 4.51 (s, Cp-H, 2H), 4.43 (s, Cp-H, 2H), 3.78 (m, OCH, 1H), 3.45-3.75 (m, OCH₂, 22H), 3.41 (m, NCH₂, 2H), 2.46 (s, CH₃, 3H); ¹³C-{¹H} NMR (CD₃CN, 100 MHz): δ 170.00 (C=O), 169.25 (C=O), 157.84 (py-C), 152.20 (py-C), 139.31 (py-CH), 119.62 (py-CH), 111.80 (py-CH), 79.27, 78.45, 78.22, 73.18, 72.52, 72.43, 71.5-70.5 (11 carbon signals), 69.20, 39.92 (NCH₂), 24.20 (CH₃); HRMS (ES+): calc. for C₃₁H₄₂N₂O₈Fe m/z 640.2321; found 640.2321.

¹H NMR spectrum of 2 in CD₃CN:
**Electrochemistry:** Cyclic voltammograms were obtained at 293 K using a three-electrode cell connected to a BAS workstation. The cell contained a nitrogen-purged acetonitrile solution of receptor (0.5 mM) and [NBu$_4$][ClO$_4$] as supporting electrolyte (0.1 M). Ag/AgCl (3M NaCl) was used as the reference electrode, with Pt wire as both counter and working electrodes. The scan rate was 250 mVs$^{-1}$.

**Binding studies:**
$^1$H NMR Job plot of complex concentration (taken from the δ value of the amide proton of receptor 1 in CD$_3$CN) against mole fraction of receptor (guest: perchlorate salt of L-Phe). The maximum at 0.5 indicates a complex stoichiometry of 1/1:

$^1$H NMR titration of the downfield shift of the signal for the H$_b$ proton of receptor 1 vs. molar equivalents of L-Phe salt:
NMR spectra (aromatic and amide NH region) of receptor 2 in CD$_3$CN (10 mM) in the absence (bottom) and presence (top) of one molar equivalent of the perchlorate salt of L-Phe:

ES$^+$ mass spectrum of the complex [M+H]$^+$, where M = 2:L-Phe.ClO$_4$:
Cyclic voltammograms of ferrocene receptor 1 in the absence and in the presence of an excess amount (ca. 5 equivalents) of dichloroacetic acid (ferrocene used as internal reference):

![Di-Chloroacetic Acid Graph](image)

NMR spectra in CD$_3$CN of (a) ferrocene receptor 1, (b) 1 plus one molar equivalent of chloroacetic acid, (c) 1 plus one molar equivalent of dichloroacetic acid.
