SUPPORTING INFORMATION

General. Infrared spectra were recorded on a Paragon 1000 FT-IR spectrometer and only peaks of interest are reported. {\textsuperscript{1}}H NMRs were reported on Bruker DPX 200, DPX 400 and AV 400 spectrometers, at a frequency of 200 and 400 MHz respectively. \textsuperscript{13}C NMRs were recorded on Bruker DPX 200, AV 400 and AMX500 spectrometers at a frequency of 50, 100 or 125 MHz respectively with CDCl{\textsubscript{3}} or Acetone-d{\textsubscript{6}} as the internal reference. Mass spectra (m/z) were recorded on Micromass GCT in Chemical Ionisation (NH\textsubscript{3}, CI\textsuperscript{+}) or Field Ionisation (FI). Analytical thin layer chromatography (TLC) was performed on Merck Silica 60 F{\textsubscript{254}} plates. All reactions were carried out under an argon atmosphere in dried glassware with magnetic stirring.

General Procedure for the Synthesis of Alkynols\textsuperscript{1}

To a stirred solution of trimethylsilylacetylene (331 µL, 2 mmol) in dry THF (4 mL) at -78°C, was added a solution of n-BuLi (2.5M) in hexane (0.96 mL, 2.4 mmol). The solution was stirred for 30 minutes prior to addition of the aldehyde (2 mmol). The mixture was stirred for a further 5 minutes and then warmed to 0°C for 2 h. The reaction was then quenched with H\textsubscript{2}O (10 mL), the aqueous layer extracted with Et\textsubscript{2}O (3x15 mL). The combined organic layers were collected and dried over MgSO\textsubscript{4}, and concentrated at reduced pressure. The resulting crude product was purified by column chromatography.

All alkynols used for the synthesis of the corresponding allenylsilanes have been previously described in the literature except 1-(trimethylsilyl)tridec-12-en-1-yn-3-ol.

\textbf{1-(Trimethylsilyl)tridec-12-en-1-yn-3-ol:} \textit{v}_{\text{max}}(\text{film})/\text{cm}^{-1} 3333, 2172, 1641 and 1250; \delta_{\text{H}} (400 MHz; CDCl\textsubscript{3}) 0.17 (9H, s), 1.24-1.50 (12H, m), 1.64-1.72 (2H, m), 1.77 (1H, broad s), 2.03 (2H, q, J = 7.0 Hz), 4.35 (1H, t, J = 6.6 Hz), 4.92 (1H, d, J = 10.0 Hz), 4.99 (1H, dd, J = 17.2, 1.0 Hz), 5.81 (1H, ddt, J = 17.2, 10.0, 6.8 Hz); \delta_{\text{C}} (100 MHz; Acetone-d\textsubscript{6}) 1.1, 27.0, 30.7, 30.8, 31.0, 31.1, 31.2, 35.5, 39.8, 63.6, 88.6, 110.7, 115.6, 140.8.

General Procedure for the Synthesis of Mesylates\textsuperscript{2}

To a stirred solution of the silylated alkynol (2 mmol) in dry DCM (alcohol free, 2 mL) at 0°C, triethylamine (558 µL, 4 mmol) was added. This was followed by the addition of methanesulfonyl chloride (232 µL, 3 mmol). The reaction was allowed to warm up to room temperature and stir for 3.5 h. It was quenched with H\textsubscript{2}O (15 mL) and

\textsuperscript{1}A. Ajamian and J. L. Gleason, \textit{Org. Lett.}, 2003, 5, 2409.
the aqueous layer was extracted with DCM (3x15 mL). The combined organic layers were dried with MgSO₄ and then filtered and concentrated at reduced pressure.

All mesylates used for the synthesis of the corresponding allenylsilanes have been previously described in the literature except 1-cyclohexyl-3-(trimethylsilyl)prop-2-ynylmethanesulfonate.

1-Cyclohexyl-3-(trimethylsilyl)prop-2-ynylmethanesulfonate:

**General Procedures for the Synthesis of Allenylsilanes**

**Protocol A:**³ To a stirred solution of CuCN·2LiCl [prepared by dissolving copper(I) cyanide (537 mg, 6 mmol) and lithium chloride (509 mg, 12 mmol) in dry THF (12 mL)], a solution of n-BuLi in hexane (6 mmol) was added drop-wise at -78°C under an argon atmosphere. After 15 minutes, a solution of 5-phenyl-1-(trimethylsilyl)-1-pent-1-yn-3-ylmethanesulfonate (2 mmol) in dry THF (5 mL) was added. It was left for 2 h and then allowed to warm up to room temperature overnight. The reaction mixture was quenched with NH₄Cl (25 mL) and the aqueous layer extracted with Et₂O (3x20 mL). The combined organic layers were dried with MgSO₄ and then filtered and concentrated at reduced pressure, affording 487 mg of product (yellow oil, 90% yield).

**Protocol B:**⁴ The mesylate was prepared by adding n-BuLi (1.6M) in hexane (2.7 mL, 4.32 mmol) and lithium bromide (375 mg, 4.32 mmol) to a stirred solution of 1-[(trimethylsilyl)ethynyl]cyclohexanol (843 mg, 4.32 mmol) in dry THF (9 mL) at -78°C. After 30 minutes at this temperature, methane sulfonyl chloride (351 \( \mu \)L, 4.54 mmol) was added and stirred at this temperature for 1 h. The mesylate in solution was used as such in the next step. For the synthesis of the silylated alene, n-BuLi (1.6M) in hexane (8.1 mL, 12.96 mmol) was added drop-wise at -78°C to a stirred solution of CuCN·2LiCl [prepared by dissolving copper(I) cyanide (1161 mg, 12.96 mmol) and lithium chloride (1099 mg, 25.92 mmol) in dry THF (20 mL)]. After 15 minutes, the freshly prepared mesylate was added. It was left for 2 h at -78°C and then allowed to warm up to room temperature overnight. The mixture was quenched by NH₄Cl (15 mL) and extracted with Et₂O (3x15 mL). The organic layers were collected and dried over MgSO₄ and concentrated at reduced pressure. The crude was purified by column chromatography (silica, hexane) affording 259 mg of pure product (yellow oil, 25% over the 2 steps).

**Protocol C:**⁵ To a stirred solution of triphenylphosphate (934 mg, 3.56 mmol) was added DIAD (701 \( \mu \)L, 3.56 mmol) at -15°C in THF (5 mL) under an argon atmosphere. After 10 minutes, a solution of 1-(trimethylsilyl)-8-(tert-butyl(dimethyl)siloxy)oct-1-yn-3-ol (772 mg, 2.37 mmol) in dry THF (2 mL) was added, followed by o-nitrobenzene sulfonyl hydrazine (769 mg, 3.56 mmol) 10 minutes.

later. This was kept at -15°C for a further hour, before being allowed to warm-up to room temperature overnight. After concentrating the mixture at reduced pressure, the crude was purified by column chromatography (silica, hexane) affording 512 mg of a colourless oil (70%).

Allenylsilanes 1b⁶ and 1c⁷ have been previously reported.
