Trichlorophenol (TCP) Sulfonate Esters: A Selective Alternative to Pentafluorophenol (PFP) Esters and Sulfonyl Chlorides for the Preparation of Sulfonamides

Jonathan D. Wilden* Lynsey Geldeard, Chieh C. Lee, Duncan B. Judd, Stephen Caddick*

Supporting Information

General. Solvents and reagents were commercially available and used without further purification, unless otherwise noted. Anhydrous solvents were used when necessary. Analytical thin layer chromatography (TLC) was performed on SIL G/UV254 silica plates and visualisation was achieved by use of UV light and potassium permanganate solution. Flash chromatography was carried out using BDH silica gel (particle size 33microm –70 microm.

$^1$H NMR spectra were recorded on a Brucker AMX 300 (300 MHz) spectrometer. Chemical shifts are reported in units parts per million (ppm) relative to the singlet at 7.26 ppm for chloroform-d. Spin multiplicities were reported as singlet (s), doublet (d), triplet (t), quartet (q), multiplet (m) and coupling constants (J) are given in Hertz (Hz).

$^{13}$C NMR spectra were recorded on a Brucker AMX 300 (75 MHz) and standard abbreviations were used (singlet (s), doublet (d), triplet (t), quartet (q)).

Mass spectra were obtained on a Kratos MS25 spectrometer.

Infra red spectra were run on a Shimadzu FTIR 8700 spectrometer or a Perkin-Elmer Spectrum One spectrometer with frequencies given in reciprocal centimetres (cm$^{-1}$). Major Features of each spectrum are reported and the following abbreviations are used: w, weak; m, medium; s, strong and br, broad.
To a solution of triphenylphosphine oxide (1.1 g, 4 mmol) in anhydrous DCM (20 ml) at 0 °C under nitrogen was added trifluoromethanesulfonic anhydride (0.3 ml, 2 mmol) and the mixture was stirred for 20 minutes. Pyridinium p-toluenesulfonate (510 mg, 2 mmol) was added and the mixture was stirred for 20 minutes. A pre-mixed solution of 2,4,6-trichlorophenol (409 mg, 2 mmol) and triethylamine (0.47 ml, 2 mmol) in DCM (5 ml) was added dropwise over a period of 10 minutes. The reaction was allowed to warm to room temperature. It was then diluted with DCM (ca. 30 ml) and washed with 2M sodium carbonate solution (2 x 30ml), 2M HCl (2 x 30 ml), water (30 ml), separated, dried (MgSO₄) and concentrated in vacuo. The crude product was purified by column chromatography (petroleum ether/diethyl ether) to yield the product as a white solid (495 mg, 69%). Data in agreement with literature values.¹

Methyl 2,4,6-trichlorophenylsulfonyl ester

Prepared as for 2,4,6-Trichlorophenyltosylate. The product was purified by column chromatography (petroleum ether/diethyl ether) to yield the product as a white solid (629 mg, 44%).

**MP** 63-66°C

**1H NMR**  δ_H (300 MHz, CDCl₃) 7.41 (2H, s, ArH), 3.46, s, CH₃

**13C NMR** δ_C (75 MHz, CDCl₃) 142.0 (s, C(Ar)), 133.1 (s, C(Ar)), 130.6 (s, C(Ar)), 129.2 (d, C(Ar)), 41.1 (q, CH₃)

4-Methoxy-benzenesulfonic acid 2,4,6-trichlorophenyl ester

To a solution of 4-methoxybenzenesulfonyl chloride (12.4 g, 60 mmol) in DCM (150 ml) at 0 °C was added a pre-mixed solution of 2,4,6-trichlorophenol (14.2 g, 72 mmol) and triethylamine (20.9 ml, 150 mmol) in DCM (50 ml) dropwise. The reaction was stirred at 0 °C for a further 15mins and allowed to warm to room temperature over 2h. The reaction mixture was washed with 2M sodium carbonate solution (2 x 50 ml), 2M HCl (2 x 50 ml) and water (50 ml), separated, dried (MgSO₄) and the solvent removed *in vacuo*. Recrystallisation from acetone gave the product as white crystals (19g, 86%).

**MP** 116-120°C (acetone)

**1H NMR**  δ_H (300 MHz, CDCl₃) 7.94 (2H, d, J = 9.1Hz, ArH), 7.03 (2H, d, J= 9.0 Hz, ArH), 7.35 (2H,s, ArH), 3.91 (3H, s, CH₃)
**N-**Allyl-4-methylbenzenesulfonamide

To a solution of TCP sulfonate (100 mg, 0.28 mmol) in NMP (1 ml) was added allylamine (45 μl, 0.56 mmol) and triethylamine (43 μl, 0.31 mmol). The mixture was heated in the microwave for 10 minutes at 140 °C. The reaction mixture was diluted with diethyl ether (20 ml) and washed with 2M sodium carbonate solution (2 x 10 ml), 2M hydrochloric acid (2 x 10 ml) and 10% Lithium chloride solution (3 x 10 ml). The organic portion was separated, dried (MgSO₄) and the solvent removed in vacuo to yield a yellow solid (50 mg, 83%). Data in agreement with literature values.³

Selective Sulfonamide formation from TCP Sulfonate Esters and PFP Sulfonate Esters

To a solution of TCP tosylate (250 mg, 0.71 mmol, 1 eq) and phenyl PFP sulfonate (230 mg, 0.71 mmol, 1 eq) in NMP (2 ml) was added 4-methylbenzylamine (90 μl, 0.71 mmol, 1 eq) and triethylamine (119 μl, 0.84 mmol, 1.2 eq) and the mixture was stirred at 40°C for 4h. Piperidine (140 μl, 1.42 mmol, 2 eq) and triethylamine (119 μl, 0.84 mmol, 1.2 eq) were added to mixture and it was heated to 100°C for 3 hours and then cooled to rt. The reaction mixture was diluted with DCM (50 ml) and washed with 2M sodium carbonate solution (2 x 15 ml), 2M hydrochloric acid (2 x 15 ml) and 10% lithium chloride solution (3 x 15 ml). The organic portion was separated, dried (MgSO₄), filtered and the solvent removed in vacuo. The crude products were separated by column chromatography (Petroleum ether/diethyl ether) to yield a 20:1 mixture of 1-Benzensulfonylpiperidine: (1-(Toluene-4-sulfonyl)-piperidine) as a pale brown solid (131 mg, 68%, 8.2%) and a 11:1 mixture of 1-(Toluene-4-sulfonyl)-piperidine: (N-(4-Methyl-benzyl)-benzenesulfonamide) as a pale brown solid (163 mg, 90%, 3.4%).
1-Benzene sulfonfylpiperidine
