General Experimental Procedures

Commercially available reagents were used without further purification. Dry THF was obtained through distillation from sodium/benzophenone ketyl and dry CH₂Cl₂ was obtained through distillation from calcium hydride. All syntheses using dry solvents were performed in oven-dried glassware. Analytical TLC was performed on MERCK silica gel, grade 60 F₂₅₄. Flash chromatography was performed on MERCK silica gel SI-60 Å (35-70). Analytical high performance liquid chromatography (HPLC) was performed on a Waters system with Waters 600E system controller, Waters 717 auto sampler, Waters 996 Photodiode Array Detector and a reverse phase Genesis C8 (4 µ 4.6 mm) column. Preparative HPLC was performed on a Waters system with Waters 600E system controller, Waters Model 441 Absorbance Detector and a reverse phase Modec CER#3900 column. Melting points were obtained using a Mettler FP90 central processor with a Mettler FP82HT hot stage and are reported uncorrected. Optical rotations were measured on a Perkin Elmer 341 LC digital polarimeter with a sodium lamp (D-line, λ=589 nm) and are reported in 10⁻¹ deg cm² g⁻¹ in the form [α]D T X° (c g/100 mL, solvent). Elemental analyses were undertaken at H. Kolbe Mikroanalytisches Laboratorium, Mühlheim an der Ruhr, Germany. Infrared spectra were obtained on a Perkin Elmer 1600 Series Fourier Transform Spectrophotometer. NMR spectra were recorded on a Varian UNITY-VXR 5000 or a JEOL Eclipse+ spectrometer (¹H, 400 MHz; ¹³C, 100 MHz). The spectra were run at ambient temperature in the reported deuterated solvent with all chemical shifts referenced with respect to the residual solvent peak (CHCl₃, δH 7.26 ppm and δC 77.16 ppm; MeOH, δH 3.31 ppm and δC 49.00 ppm; ACN, δH 1.94 ppm and δC 118.26 ppm). J values are given in Hz. All LCMS were obtained on an Agilent 1100 series module (column, Phenomenx Synergi MAX-RP C12 50 x 3 mm 4µm; eluent, 10 mM ammonium acetate in acetonitrile/water gradient); flow, 1.25 mL/min; temperature, 50 °C with a Waters ZQ 2000 mass spectrometer with pos/neg switch using DAD as the primary detector and ELS as secondary detector.
Experimental Details for the Synthesis of Oseltamivir

(trans-3-Ethoxycarbonylallyl)triphenylphosphonium bromide:

(trans-3-Ethoxycarbonylallyl)triphenylphosphonium bromide was prepared from ethyl 4-bromocrotonate and triphenylphosphine according to Howe, with the use of toluene instead of benzene as the solvent. Increasing the reaction time from 4 h to 2 days, increased the yield to 90% compared with the 45% originally reported. Spectral data for this compound were in accordance with that previously published.

Ethyl 1,3-Cyclohexadien-1-carboxylate (1):
The synthesis of 1 was undertaken following the previously published procedure for that of the closely related methyl ester, utilizing (trans-3-ethoxycarbonylallyl)triphenylphosphonium bromide and acrolein. Spectral data were in accordance with published data for this compound.

Tricarbonyl(1-carboethoxy cyclohexa-1,3-dienyl)iron ((±)-2):

Ethyl 1,3-cyclohexadien-1-carboxylate (1) (1.29 g, 8.5 mmol) was dissolved in degassed toluene (10 mL) and to this was added a slurry of iron nonacarbonyl* (10 g, 27.5 mmol) in degassed toluene (10 mL). The reaction mixture was stirred at 55 °C under an argon atmosphere for 19 h, after which, it was allowed to cool to room temperature. Absorption onto silica and flash column chromatography washing with petroleum ether, followed by elution with 5% EtOAc in petroleum ether, gave (±)-2 (2.15 g, 86%) as a yellow oil; Anal. * Treated with 1M HCl to remove any pyrophoric free metallic iron and then washed successively with ethanol and toluene.
Tricarbonyl(1-carboethoxycyclohexa-1,3-dienyl)iron Hexafluorophosphate ((±)-3):

Tricarbonyl(1-carboethoxycyclohexa-1,3-dienyl)iron ((±)-2) (2.15 g, 7.4 mmol) was dissolved in dry CH₂Cl₂ (30 mL) and triphenylcarbenium hexafluorophosphate (3.72 g, 9.6 mmol) was added portionwise. The reaction mixture was stirred at ambient temperature under an atmosphere of nitrogen for 6 h. Addition of Et₂O (50 mL), gave a precipitate that was isolated by filtration, washed with Et₂O and dried under vacuum affording racemic (±)-3 (3.03 g, 94%) as a pale yellow powder; Anal. Tricarbonyl[1-carboethoxy-5-[[1R,2S]-trans-2-phenylcyclohexyl]oxy]cyclohexa-1,3-diene]iron (4a,b):

A suspension of the racemic cationic iron complex (±)-3 (1.24 g, 2.8 mmol) and (-)-(1R,2S)-trans-2-phenylcyclohexanol (1.02 g, 5.7 mmol) in dry CH₂Cl₂ (20 mL) under argon was cooled on an ice bath to 0 °C. Diisopropylethyl amine (0.61 mL, 3.4 mmol) was added dropwise and the reaction mixture stirred on ice for 20 min before allowing it to warm to room temperature over 30 min. The reaction mix was concentrated and the addition of petroleum ether (60 mL) resulted in a precipitate that was removed by filtration and the eluant was concentrated under vacuum. Crude ¹H NMR indicated a 50:50 ratio of two diastereomers. The residue underwent flash column chromatography (5% EtOAc in petroleum ether) to give a diastereomeric mix of 4a,b (0.99 g, 75%) as a yellow oil; Anal. Calc. for C₂₄H₂₆FeO₆: C, 61.82; H, 5.62. A further fraction containing slight product and the excess chiral alcohol underwent recrystallisation to afford pure (−)-(1R,2S)-trans-2-phenylcyclohexanol (0.37 g, 75% of excess).

The diastereomeric pair 4a,b was separated by preparative HPLC with isocratic solvent conditions of 80% ACN:20% buffer (5% ACN, 0.1 M ammonium acetate) to give a small amount of mixture (8% recovered), along with the individual diastereomers 4a (36% recovered) and 4b (47% recovered) as yellow oils for which the diastereomeric purity was confirmed by analytical HPLC.†

Ethyl 5-(tert-Butoxycarbonylamino)-cyclohexa-1,3-diene-1-carboxylate \((\pm)-6\):

**Racemic \((\pm)-6\).**

To a solution of the iron complex \((\pm)-5\) (2.13 g, 5.2 mmol) in EtOH (100 mL) on an ice bath at 0 °C was added aqueous hydrogen peroxide (30%, 36 mL, 408 mmol), followed by the dropwise addition of 1 M NaOH (31.5 mL, 31.5 mmol) and the reaction mixture was stirred on ice under a nitrogen atmosphere for 5 min. The reaction was diluted with brine (200 mL) and the product extracted with CH\(_2\)Cl\(_2\) (3x200 mL). The combined organic phases were dried over MgSO\(_4\), filtered and concentrated, affording \((\pm)-6\) as a light yellow oil (1.33 g, 95%) of sufficiently high purity to be used directly in the next step. An analytically pure sample was prepared by flash chromatography eluting with a gradient of 5-10% EtOAc in petroleum ether to give an oil that partially crystallized on standing; Anal.
