General. All manipulations were carried out in a nitrogen-filled gloved box and with standard Schlenk techniques under an argon atmosphere. Column chromatography was performed with silica gel 60N (Kanto). Preparative thin-layer chromatography was performed with silica gel 60 PF₂₅₄ (Merck). Gel permeation chromatography was carried out on a JAI LC-908. NMR spectra were recorded on a Varian Gemini 2000 (¹H at 300.77 MHz and ¹³C NMR at 75.46 MHz), a JEOL JNM-A400 (¹¹B at 128.15 MHz and ²⁹Si at 79.30 Hz), or a JEOL JNM-ECA600 (¹³C NMR at 150.92 MHz). Proton chemical shifts were referenced to the residual proton signals in CDCl₃ (δ 7.26 ppm) and C₆D₆ (δ 7.16 ppm). Carbon chemical shifts were referenced to the carbon signals in CDCl₃ (δ 77.00 ppm) and C₆D₆ (δ 128.00 ppm). Boron and silicon chemical shifts were referenced to external standards BF₃·OEt₂ (δ 0.0 ppm) and SiMe₄ (δ 0.0 ppm), respectively. High resolution mass spectra were recorded on a JEOL JMS-SX102A. UV-vis spectra were recorded on a JASCO V-550. Fluorescence spectra were recorded on a JASCO FP-777. Thermal data were obtained using an SII EXSTAR6000 DSC6220 at a heating rate 10 °C/min. The molecular weights of polymers were determined by gel permeation chromatography measured in CHCl₃ at 40 °C with a system consisting of a TOSOH 8020 series and Shodex columns (K-805L and K-804L).

Materials. [Cp*Ru(MeCN)₃]PF₆ (**1**)¹ and 9-Silafluorene (**3d**)² were prepared according to literature procedures. 1,2-Dichloroethane was distilled from calcium hydride. All other reagents and solvents were used as received without further purification.
