Cationic Corrole Derivatives: A New Family of G-quadruplex Inducing and Stabilising Ligands

Boqiao Fu, Jing Huang, Lige Ren, Xiaocheng Weng, Yangyang Zhou, Yuhao Du, Xiaojun Wu, Xiang Zhou*, and Guangfu Yang

Synthesis of corrole 3 and 5.

Synthesis of compound 1 (5, 10, 15-tris[4-pyridyl]-corrole): 1 pyrrole (4.2 ml, 40.5 mmol) and aldehyde (2.21 g, 20.2 mmol) were dissolved in 200 mL of acetic acid. The solution was heated and stirred under 110 °C. The reaction course was monitored by UV/Vis spectroscopy. After 4 h, the reaction mixture was cooled down and the solvent with excess pyrrole were evaporated under reduced pressure. The crude product was crushed down and further isolated by the chromatography on neutral alumina (200-300 mesh). After elution with ethyl acetate/CH3OH = 10/1) collected desired compound, isolated compound 1 was obtained after evaporation of solvents. Further purification was finished by crystallization from CH2Cl2/Hexane and obtained pure solid compound 1 (94 mg, yield, 2.6%).

UV/vis(CH2Cl2): λmax[nm](log ε) = 417 (4.55), 576 (3.81), 616 (3.59), 651 (3.43); 1H NMR (300 MHz, CDCl3) δ (ppm) 8.10 (d, 2 H, J = 4.5 Hz, 2 H), 8.26 (d, J = 4.5 Hz, 4 H), 8.60 (d, J = 3.6 Hz, 2 H), 8.64 (d, J = 3.6 Hz, 2 H), 8.93 (m, 4 H), 8.99 (s, 4 H), 9.04 (s, 2 H); 13C NMR (CDCl3) δ (ppm) 98.5, 108.8, 113.2, 117.3, 117.3, 122.9, 126.5, 127.2, 130.0, 131.8, 135.0, 140.0, 140.5, 147.2, 148.8, 149.4, 150.1; MS FAB (positive) m/z: calculated for:C34H23N8+, 530; found: 530.

Synthesis of compound 3 (5, 10, 15-tris[N-methyl-4-pyridinium]-corrole): compound 1 (30 mg, 0.057 mmol) was dissolved in 25 mL of DMF. CH3I (5 mL) was added into the solution and the reaction mixture was stirred at room temperature in dark for a whole night. The solvent and excess CH3I were evaporated under reduced pressure. The crude product was further crystallized by Et2O/DMF and purified compound 2 was obtained (45 mg, yield: 87%).

UV/vis(CH3OH): λmax[nm] (log ε ) = 527 (8.06), 702 (7.72) 1H NMR (300MHz, [D6]DMSO): δ (ppm) 8.67 (d, 2 H, J = 4.2 Hz), 8.78 (s, 4 H), 8.91 (d, 4 H, J = 5.7 Hz), 8.97 (d, 2 H, J = 4.2 Hz), 9.25 (d, 6 H, J = 4.5 Hz), 9.30 (d, 2H, J = 6.6 Hz); 13C NMR ([D6]DMSO): δ (ppm) 108.1, 109.5, 119.8, 124.2, 126.1, 126.8, 132.6, 133.1, 134.7, 136.1, 139.3, 140.7, 144.2, 144.6, 155.9, 159.5; HRMS(ESI), m/z: calculated for: (M3+-3I)/3 = 191.4239; (M2+-3I-H)/2 = 286.6315; found: 191.4234 (M3+-3I)/3, 286.6317 (M2+-3I-H)/2; elemental analysis calcd (%) for C37H32N7I3; C 46.51, H 3.38, N 10.26; found: C 46.19, H 2.92, N 10.09; melting point: >300°C; green solid.
Synthesis of compound 4 (5, 10, 15-tris[4-aminophenyl]-corrole): Compound 2 (420 mg, 0.635 mmol) and SnCl₂·2H₂O (1.29 g, 5.72 mmol) were mixed to form a homogeneous powder and this mixture was dissolved in 37% aq. HCl (50 mL). The reaction was protected by the N₂ without light. After the mixture was stirred for 2 h at 75°C, the solution was cooled by adding ice. The crude product was neutralized to pH = 7 by NH₃·H₂O. The reaction mixture was diluted with a very large excess of water (400 mL) and extracted with ethyl acetate (3 × 300 ml). The organic layers were combined and the solvents were removed under the reduced pressure. The crude product was purified by chromatography over silica gel (elucent: CH₂Cl₂/ethyl acetate = 1:1 vol) and purified compound was obtained in 140 mg after crystallization from acetone/petroleum ether. The yield was 38%. UV/vis (acetone): \( \lambda_{\text{max}} [\text{nm}] (\log \varepsilon) = 429 (5.60), 526 (4.80), 565 (4.83), 637 (4.80), 661 (4.82); ^1\text{H NMR (300 MHz, [d₆]-acetone)} \delta (ppm) -2.59 (s, 3 H), 5.13 (s, 4 H), 5.24 (s, 2 H), 6.55-6.74 (m, 6 H), 7.12 (d, 4 H, \( J = 8.4 \) Hz), 7.34 (m, 2 H), 7.93 (d, \( J = 8.1 \) Hz, 4 H), 8.95 (s, 4 H); \(^{13}\text{C NMR ([d₆]-acetone)} \delta (ppm) 113.05, 113.71, 114.39, 114.66, 117.28, 118.21, 119.53, 120.89, 124.94, 127.38, 128.27, 130.58, 131.29, 133.06, 135.23, 135.76, 148.57, 150.93; HRMS(MALDI-TOF), \text{m/z: calculated for C}_{37}\text{H}_{29}\text{N}_{7} = 571.2484; \text{found: 571.2479.}

Synthesis of 5 (5, 10, 15-tris[N-trimethyl-4-aminiumphenyl]-corrole): Compound 4 (43 mg, 0.075 mmol) was dissolved in 40 mL of acetone and 10 mL of CH₃I was added to the solution. The mixture was stirring under 40°C oil bath for seven days. The course of the reaction was monitored by ESI-MS. The rest of CH₃I and solvent was removed under reduced pressure. The desired product was crystallized with Et₂O/acetone in 53 mg (yield 65%). UV/vis (acetone) (logε) = 416 nm (4.88), 579 (4.09), 617 (3.98); \(^1\text{H NMR (300 MHz, [d₆]-acetone)} \delta (ppm) 4.24 (s, 27 H), 8.56-8.61 (brs, 14 H), 8.97 (s, 4 H), 9.22 (s, 2 H); \(^{13}\text{C NMR([d₆]-acetone)} \delta (ppm) 58.39, 119.30, 120.19, 121.37, 136.68, 137.12, 144.71, 147.56, 148.16; \text{HRMS(ESI), m/z: calculated for: (M}^{3+}-3\text{I)/3 = 233.4703; found: 233.4693; elemental analysis calcld (%) for C}_{46}\text{H}_{50}\text{N}_{7}\text{I}_{3}: C 51.08, H 4.66, N 9.06; found: C 50.79, H 4.50, N 8.87; melting point: >300°C; black-green solid.

General material
Four 5’-biotin-labeled oligomers were used in surface plasmon resonance studies: [G4]: 5’biotin-AG₃(TTAG₃)₃-3’;[AT]: 5’biotin-CGAATTCGTCTCCGAATTCG-3’; [GC]: 5’biotin-CGCGCGC GT TTTCGGCGCCG-3’;DNA duplex: 5’ biotin- TTTCCT GCAGCG CGATT GTGAA CA-3’ Its complementary strand: (5’–TGTTT ACAAT CGGCG GCAG-3’). The template
sequence HT4 (5’-TCCAA CTATG TATA C TTAGGG TTAGGG TTAGGG ACATA TCAGT GAAAT TGCTA TAGTG AGTCG TATTA-3’) and 5’Tamra labeled P18 (5’-TAATA CGACT CACTATAG-3’) were used for DNA polymerase stop assay. The products in DNA polymerase stop assay were separated on a 20% denaturing polyacrylamide gel for electrophoresis, and the gel was autoradiographed on a Typhoon Phosphor Imager (Amersham Biosciences, AB, Uppsala, Sweden).

CD melting curves were measured by monitoring the absorbance at 295 nm on a Jasco-810 spectropolarimeter (Jasco, Easton, MD) using a quartz cell of 1-mm optical path length with a digital circulating water bath, while the temperature was ramped from 25 to 90°C at about 1.5°C/min.

CD spectra were recorded on a Jasco-810 spectropolarimeter (Jasco, Easton, MD) using a quartz cell of 1-mm optical path length and an instrument scanning speed of 100 nm/min with a response time of 1 s, and over a wavelength range of 220-350 nm. All CD spectra were baseline-corrected for signal contributions due to the buffer.

Fig. S5. (a) Minimized model of a complex between corrole 5 and the human d(AG₃[T₂AG₃]₃) quadruplex. The G is colored in yellow, the lateral loop and diagonal loop are in red, and the ligand in green. The hydrogens of G-quadruplex are omit for clarity. (b) The top view of complex a. Only the terminal G-quartet is shown.

Fig. S6. (a) Minimized model of a complex between corrole 3 and the human d(AG₃[T₂AG₃]₃) quadruplex. The G is colored in yellow, the lateral loop and diagonal loop are in red, and the ligand in green. The hydrogens of G-quadruplex are omit for clarity. (b) The top view of complex. Only the terminal G-quartet is shown.

Molecular Modeling: Models were built by the SYBYL¹ package. The coordinates of the folded intramolecular G-quadruplex human telomeric repeat d(AG₃[T₂AG₃]₃) were obtained from the Brookhaven Protein Data Bank (PDB entry: 143D). The models of ligands were built manually and optimized by Gaussian03 ² using DFT method at 6-31G level. Hydrogen-bonding constraints were added to the G-tetrads. Ligand was inserted above the G-tetrad, and the complex was allowed to minimize using Gasteiger-Hückel charges, the Tripos force field (First 1000 steps steepest descent then 1000 steps conjugate gradient to a terminal gradient of 0.05 kcal/mol).
