Chemical synthesis.

General Procedures: 17α-ethynyl-β-estradiol (1) and 2-phenylquinoline-4-carboxylic acid (6) were purchased from Sigma Co. and Aldrich Co., respectively. Melting points were determined on a micro hot-stage (Yanako MP-S3) and were uncorrected. Optical rotations were measured on a JASCO DIP-370 photo-electric polarimeter. 1H-NMR spectra were recorded on a Varian MVX-300 (300 MHz) spectrometer using trimethylsilane as internal standard unless otherwise noted. Silica gel TLC and column chromatography were performed on Merck TLC 60F-254 (0.25 mm) and Silica Gel 60 N (spherical, neutral) (Kanto Chemical Co., Inc.), respectively. Air- and/or moisture-sensitive reactions were carried out under an
atmosphere of argon using oven-dried glassware. In general, organic solvents were purified and dried using an appropriate procedure, and evaporation and concentration were carried out under reduced pressure below 30 °C, unless otherwise noted.

3-O-tert-Butyldimethylsilyl-17α-ethynyl-β-estradiol (4): To a stirred solution of 3 (309 mg, 1.04 mmol) in dry CH₂Cl₂ (15 mL) was added 2,6-lutidine (180 μL, 1.56 mmol) and TBSOTf (290 μL, 1.25 mmol) at 0 °C. After stirring for 2 h at 25 °C, the mixture was poured into ice-cold water. The resultant mixture was extracted with CHCl₃ and the extracts were washed with brine, dried over anhydrous Na₂SO₄ and concentrated in vacuo. Purification of the residue by column chromatography (40 g of silica gel, 3/1 n-hexane/EtOAc) gave 4 (428 mg, 100%) as white solids. **Protein photo-degradation.**

Human estrogen receptor-α (hER-α), bovine serum albumin (BSA) and hen egg lysozyme (Lyso) were purchased from Sigma Co. A UV lamp (365 nm, 100 W, Blak-ray (B-100A), UVP. Inc.) was used for the photo-irradiation. All the protein degradation experiments were performed with hER-α, BSA or Lyso (1.0 μM) in a volume of 10 μL containing 20% acetonitrile in 50 mM Tris-HCl buffer (pH 8.0) at 25 °C for 2 h under irradiation of the UV lamp placed at 10 cm from the mixture. The protein-sample levels were varied as indicated in the figure captions.

**Electrophoresis.**

SDS/polyacrylamide gel electrophoresis (SDS-PAGE) experiments were performed as reported.\(^1\) After addition of a 4.8 μL solution containing SDS (5%, wt/vol), glycerol (27%, vol/vol), DTT (0.5%, wt/vol) and bromophenol blue (0.007%, wt/vol) to the photoirradiated samples. Gels (8% for BSA and 12% for hER-α and Lyso) were run by applying 110 V for 1.5 h for BSA or 2.5 h for hER-α and Lyso. The gels were stained with SYPRO Ruby Protein Gel Stain (Bio-Rad Lab. Inc.) for 3 h, destained in acetic acid (7%, vol/vol) and methanol (10%, vol/vol) for 0.5 h, and then washed with water. The gels were scanned with a Molecular Imager FX (Bio-Rad Lab. Inc.) and images were processed using Adobe Photoshop software. Molecular weight markers were used in each gel for calibration.
ESR Spectrometry.

ESR spectrum\(^2\) was recorded using a Bruker BioSpin EMX EPR operating at 9.5 GHz with 100 kHz modulation. A mixture of \(2\) (4 mM) and DMPO (100 mM) in a volume of 1.0 mL containing 50% acetonitrile Tris-HCl buffer (pH 8.0, 50 mM) was placed in a quartz flat cell and irradiated directly inside the microwave cavity of the spectrometer using a UV lamp (365 nm, 100 W, Blak-ray (B-100A), UVP. Inc.).

SI-Fig. S1. ESR spectra obtained a) by treatment of DMPO with \(2\) without photo-irradiation or b) by photo-irradiation of DMPO in the absence of \(2\). Compound \(2\) (4 mM) and DMPO (100 mM) were used in 50% acetonitrile/Tris-HCl buffer (pH 8.0, 50 mM).
