Supporting Information

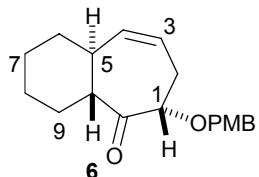

General procedure for rhodium(II) acetate catalysed ylide formation and rearrangement.

A solution of the α -diazo ketone (0.46 mmol) in CH_2Cl_2 (60 mL) was added dropwise over 1.25 h to a stirred solution of rhodium(II) acetate dimer (2 mol%, 9 μmol) in CH_2Cl_2 (45 mL) at room temperature under an atmosphere of argon. After addition was complete, the reaction mixture was concentrated *in vacuo* to give a green oil and the crude product was then purified by flash column chromatography on silica gel.

General procedure for copper(II) hexafluoroacetylacetone catalysed ylide formation and rearrangement.

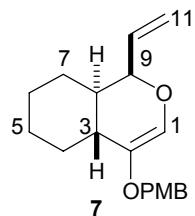

A solution of the α -diazo ketone (0.46 mmol) in CH_2Cl_2 (60 mL) was added dropwise over 1 h to a stirred solution of copper(II) hexafluoroacetylacetone (2 mol%, 9 μmol) in CH_2Cl_2 (45 mL) heated at reflux under an atmosphere of argon. After addition was complete, the reaction mixture was stirred for a further 30 min. Then the reaction mixture was concentrated *in vacuo* to a green oil and then purified by flash column chromatography.
