General methods: ¹H NMR and ¹³C NMR spectra were obtained from spectrometers operating at 200 MHz, 300 MHz or 500 MHz for proton nucleus in CDCl₃ solutions, except otherwise stated. ¹H chemical shifts are reported in ppm relative to TMS (0.0 ppm) as an internal standard. ¹³C chemical shifts are reported relative to the central peak of CDCl₃ (77.0 ppm). Low and high resolution mass spectra were taken on a HP5989A spectrometer using the electronic impact (EI) or electrospray modes (ES) unless otherwise stated. Specific rotation [α]D is given in 10⁻¹ deg cm² g⁻¹ at 20 ºC, and the concentration (c) is expressed in g per 100 mL. All commercially available compounds were used without further purification.

General Procedure for the β-lactam ring expansion reaction: Synthesis of pyrrolidin-2-one derivatives 2 and 5. A solution of TBSCN (1.50-5.00 mmol) in anhydrous acetonitrile (3.4 mL) was added dropwise via syringe to a stirred solution of the appropriate 4-oxoazetidine-2-carbaldehyde 1 or 4 (1.00 mmol) and iodine (0.10 mmol) in the same solvent (3.4 mL) at room temperature and under argon atmosphere. The reaction mixture was stirred at room temperature until disappearance of starting material (TLC). Then, a saturated aqueous NaCl solution (10 mL was added and the resulting mixture was extracted with DCM (5 x 20 mL). The organic layer was dried (MgSO₄), filtered and concentrated under reduced pressure. Analytically pure adducts 2 or 5
were obtained after flash chromatography of the residue on silica gel eluting with hexanes/ethyl acetate mixtures.
