**Experimental Section:**

**A. Materials and Methods:** (-)-Riboflavin (R) and Melamine (M) were purchased from Aldrich Chemical Co., USA. Mixtures of riboflavin and melamine in different mole ratios (e.g., 4:1, 3:1, 2:1, 1:1, 1:2, 1:3) were taken in glass tubes and water was added to make the total complex concentration 0.2% (w/v). It was then sealed, and heated to 120°C to solubilize the components homogeneously and quenched to room temperature to have a yellow colored gel. Then the gels were frozen dried to get dried gels.

**B. Field Emission Scanning Electron Microscopy (FESEM):** To understand the morphology of the gel small portions of the hydrogels of different RM compositions, produced at 30°C, were placed on glass cover slip. They were dried in air at room temperature, finally in vacuum at 30°C and then they were observed through a FESEM instrument (JEOL, JSM 6700F) operating at 5 KV.

**C. Atomic Force Microscopy.** The morphology of the RM31xerogel was studied using atomic force microscopy (Veeco, model AP0100). The AFM study was conducted in noncontact mode at a tip resonance frequency of 300 kHz. The sample was cast on a glass slide and the pictures were taken in amplitude mode.

**D. Photoluminescence Spectroscopy:** Fluorescence studies of RM hydrogel samples, prepared in a sealed cuvette, were made in a Horiba Jobin Yvon Fluoromax 3 instrument. The gel samples were taken in a Quartz cell of path length one cm and were excited at 365 nm. The emission scans were taken from 400 nm to 800 nm using slit width 2 nm with an increment of wavelength 1 nm having integration time 0.5 second. For the dried gels the same amount of solid sample was taken in a quartz holder and the spectra was taken as above.
Supplementary Figure 1: FESEM images of xerogels of 0.2% w/v hydrogels of (a) RM41, (b) RM31, (c) RM21, (d) RM11, (e) RM12 and (f) RM13 (inset of figure 1(d): bunch of tubes obtained from RM11 xerogel)
Supplementary Figure 2: AFM images of RM31 xerogel of 0.09% (w/v) hydrogel.
**Supplementary Figure 3:** Plot of fluorescent intensity (normalized to same riboflavin concentration) vs. wavelength for different 0.2 % (w/v) hydrogels.
**Supplementary Figure 4:** UV-Vis spectra at 30° C of different RM hydrogels of concentration of 0.09% (w/v).
**Supplementary Figure 5:** UV-Vis spectra of different RM xerogels derived from 0.09 % (w/v) hydrogels.
