Experimental Section

General

$^1$H NMR (500 MHz) spectrum was measured in CDCl$_3$ at 25 °C on a Bruker Avance 500 spectrometer. Transition electron microscopic (TEM) observations were performed by using JEM-1200EX II and JEM-1230 BU with an acceleration voltage of 120 kV and 100 kV, respectively. TEM samples were prepared by dropping of the CHCl$_3$ solution of gold nanoparticle (AuNP) on 150 mesh carbon coated copper grids, which were purchased from Okensyoji. UV-vis spectrum was measured in CHCl$_3$ at 25 °C on a Hitachi U3310 spectrometer. Chloroauric acid tetrahydrate was purchased from Tanaka Kikinzoku Kogyo. Triethylsilane was purchased from Shin-Etsu Chemicals. Other chemicals were purchased and used as such.

General procedure for thiol-capped AuNP 1

To a screw-capped test tube equipped with a magnetic stirring bar were added HAuCl$_4$·4H$_2$O (0.1 mmol, 41.2 mg), dodecanethiol (0.1 mmol, 23.9 μL) and THF (10 mL). Resulting mixture was vigorously stirred for 3 h at 25 °C to form a yellow solution. Triethylsilane (0.1 mmol, 15.9 μL) was then added dropwise at 25 °C to form immediately a purple solution. After stirring for further 6 h at 25 °C, ethanol was added to the solution to precipitate the AuNP, which was separated by centrifuge, washed with ethanol and dried under reduced pressure to afford 15.1 mg of 1. $^1$H NMR δ 0.88 (t, $J$ = 6.6 Hz, CH$_3$), 1.26 (broad, CH$_2$). UV-vis (CHCl$_3$) $\lambda_{\max}$ = 528. The spectroscopic properties were identical with those of authentic sample (see reference 3 and 4).
