b: The value of log ε at 250 nm, it diminishes gradually toward 0 at ca. 310 nm, the end of absorption.
c: The value of Δε at 250 nm, it increases gradually toward 0 at around 280 nm.
Experimental

Preparation of achiral 1a

To a solution of 4a (160 mg, 0.205 mmol) and iodomethane (380 μL, 6.10 mmol) in THF (30 mL) was added 60% NaH in oil (50 mg, 1.25 mmol), and the mixture was refluxed for 74 h. The solution was diluted with ethyl acetate, and was washed with 1N HCl aq., sodium thiosulfate aq., and brine. The organic layer was dried over MgSO4. Chromatographic separation on preparative TLC plates (SiO2, 1 mm thickness, 10% ethylacetate/CHCl3) gave 43 mg of syn-1a and 86 mg of anti-1a in 26% and 52% yields, respectively. Analytical samples of syn-1a and anti-1a were obtained by recrystallization from ethyl acetate and ethyl acetate/benzene, respectively.

Preparation of (R,R)-3b

A mixture of 2,3,5,6-tetrabromoterephthalic acid (3.16 g, 6.56 mmol), benzyltriethylammonium chloride (36 mg, 0.16 mmol) and thionyl chloride (25 mL) was refluxed for 2.5 h under an argon atmosphere. After removal of thionyl chloride by evaporation, the remaining solid was dissolved in THF (60 mL). To a solution of (R)-1-cyclohexylethylamine (1.95 mL, 13.1 mmol) and triethylamine (1.90 mL, 13.7 mmol) in THF (10 mL) was added the THF solution of the acid chloride via cannula. The mixture was stirred at 45 °C for 20.5 h. After removal of the solvent, the remaining solid was suspended in water and filtrated to give 4.40 g of (R,R)-3b as a white solid in 96% yield.

The structure was solved by the direct method (SIR92) and refined by the full-matrix least-squares method on $F^2$ with anisotropic temperature factors for non-hydrogen atoms. All the hydrogen atoms are located at the calculated positions. The final $R$ and $R_w$ values are 0.0699 and 0.1834 for 2736 reflections with $I > 2σI$ and 624 parameters. Estimated standard deviations for $(R,R)$-anti-$1b$ are 0.009-0.018 Å for bond lengths and 0.7-1.6° for bond angles, respectively. The absolute configuration was determined by chemical correlation. The refined Flack parameter is -3(5). CCDC 380698.
