General remarks: Bis(oxazoline) bearing phenyl groups was prepared from (R)-phenylglycinol and dimethylmalononitrile by a modified procedure.1

Preparation of immobilized catalysts by cation exchange: Laponite was dried under vacuum at 140°C for 24 h prior to use. The chiral ligand (0.11 mmol) and Cu(OTf)₂ (40 mg, 0.11 mmol) were dissolved in the minimum amount of anhydrous dichloromethane under an argon atmosphere. The solution was stirred for 15 min and filtered through a PTFE microfilter. The solvent was removed under reduced pressure, the complex was redissolved in methanol (4 mL), dry Laponite (375 mg) was added and the suspension was stirred for 24 h at room temperature. The solid was filtered off, washed with methanol (10 mL) and dichloromethane (20 mL) and then dried under vacuum for 24 h.

Homogeneous Mukaiyama aldol reactions with methyl pyruvate (1a): A suspension of the bis(oxazoline) ligand (0.05 mmol) and Cu(OTf)₂ (0.05 mmol) in anhydrous dichloromethane (1 mL) was stirred for 15 min under an inert atmosphere. The mixture was filtered through a microfilter and the solvent was evaporated under vacuum. Anhydrous CH₂Cl₂ (2 mL), methyl pyruvate (1a, 0.5 mmol) and 2-(trimethylsilyloxy)furan (2, 0.6 mmol) were added by syringe and the reaction mixture was stirred at room temperature under an inert atmosphere. The

consumption of the cyclic silane was monitored by GC. The mixture was filtered through a silica pad (2 cm), which was washed with dichloromethane. The resulting solution was concentrated under vacuum and the mixture analyzed by HPLC (Chiralpak AD-H column, hexane/isopropanol (90:10), 1 mL min⁻¹, UV detector at λ=210 nm). A previous calibration was necessary to determine the yield. The retention times were for the anti enantiomers: $t_r(5a) = 13.2$ min and $t_r(6a) = 14.0$ min; and for the syn enantiomers: $t_r = 19.1$ min and $t_r = 25.4$ min. The absolute configurations of the anti enantiomers were assigned by comparison with the results reported by Evans et al.²

**Homogeneous Mukaiyama aldol reactions with methyl 2-oxo-2-phenylacetate (1b):** The procedure is the same as in the case of using methyl pyruvate with the following reagents: methyl 2-oxo-2-phenylacetate (1b, 0.5 mmol) and 2-(trimethylsilyloxy)furan (2, 0.6 mmol). At the end of the reaction and after the filtration through the silica pad, the solvent was eliminated under vacuum and the mixture analyzed by HPLC (Chiralcel OD-H column, hexane/isopropanol (90:10), 1 mL min⁻¹, UV detector at λ=209 nm). The retention times were for the syn enantiomers: $t_r = 14.8$ min and $t_r = 19.3$ min and for the anti enantiomers: $t_r(5b) = 24.8$ min and $t_r(6b) = 26.6$ min.

Methyl 2-hydroxy-2-[5-oxofuran-2(2H)-yl]-2-phenylacetate (3b, 4b, 5b, 6b): The products were prepared according to the typical procedure. Then, the crude of the reaction was purified by silica gel column chromatography (30% ethyl acetate/hexane) to afford in both cases a white solid.

**Syn isomers (3b+4b):** $^1$H NMR (400 MHz, CDCl$_3$, δ ppm): 7.70-7.68 (m, 2H), 7.45-7.39 (m, 3H), 6.95 (dd, $J=1.6$ Hz, $J=5.8$ Hz, 1H), 6.17 (dd, $J=2.0$ Hz, $J=5.8$ Hz, 1H), 5.77 (t, $J=1.6$ Hz, 1H), 3.9 (s, 3H), 3.83 (s, 1H). $^{13}$C NMR (100 MHz, CDCl$_3$, δ ppm): 172.5, 172.1, 151.3, 136.2, 129.1, 128.9, 125.5, 123.9, 86.2, 77.4, 54.2.

**Anti isomers (5b+6b):** $^1$H NMR (400 MHz, CDCl$_3$, δ ppm): 7.60-7.57 (m, 2H), 7.41-7.33 (m, 4H), 6.14 (dd, $J=2.0$ Hz, $J=5.6$ Hz, 1H), 5.55 (m, 1H), 3.87 (s, 3H), 3.70 (br, 1H). $^{13}$C NMR (100 MHz, CDCl$_3$, δ ppm): 171.4, 170.8, 151.3, 135.6, 127.9, 127.6, 124.8, 122.8, 84.7, 77.4, 52.7.
Representative procedure for heterogeneous Mukaiyama aldol reactions: To a solution of methyl pyruvate (1a, 0.5 mmol) and 2-(trimethylsilyloxy)furan (2, 0.6 mmol) in anhydrous CH₂Cl₂ (2 mL) was added the solid catalyst (217 mg, 10 mol%). The resulting suspension was stirred at room temperature under an inert atmosphere. The consumption of the cyclic silane was monitored by GC. The mixture was filtered and the filtrate was concentrated under vacuum and analyzed by HPLC. The solid catalyst was repeatedly washed with anhydrous dichloromethane, dried under vacuum and reused under the same conditions.

X-ray analyses: Intensity data for both molecules were collected at low temperature (100(2)K) on a Bruker SMART (3b and 4b) or Oxford Diffraction Xcalibur Nova (5b) CCD area detector diffractometers. Graphite monochromated MoKα (3b and 4b; λ = 0.71073 Å) or CuKα (5b; λ = 1.54178 Å) radiations (5b) were used. Cell parameters were refined from the observed setting angles and detector positions of strong reflections (2598 reflns, 2θ ≤ 27.0° for 3b and 4b; 4998 reflns, 2θ ≤ 73.47° for 5b). Data were corrected for Lorentz and polarization effects, and multiscan absorption corrections were also applied. The structures were solved by direct methods (SHELXS86) and completed by successive difference Fourier synthesis. Refinement, by full-matrix least-squares on F² was carried out with SHELXL97, including all non-hydrogen atoms in both structures with anisotropic displacement parameters. Hydrogen atoms were included in the refinement from observed positions and refined as free isotropic atoms. No significant residual (< 0.475 eÅ⁻³) was observed in the final Fourier maps.

Crystal data for the mixture of the syn enantiomers 3b and 4b: C₁₃H₁₂O₅, M = 248.23, monoclinic, P2(1)/c; a = 11.5169(15), b = 7.9585(11), c = 13.1517(17) Å, β = 94.033(2)°, V = 1202.5(3) Å³, Z = 4, Dc = 1.371 g cm⁻³, μ (Mo-Kα) = 1.06 cm⁻¹. Crystal dimensions 0.164 × 0.163 × 0.161 mm, 7457 reflections measured, 2602 unique (Rint = 0.0222); number of data/restraints/parameters 2602/0/211; final GoF 1.046, R = 0.0425 (2295 reflns, I>2σ(I)), wR² = 0.1075 for all data. Crystal data for the anti enantiomer 5b: C₁₃H₁₂O₅, M = 248.23, monoclinic, P2(1), a = 7.5836(15), b = 5.7612(12), c = 13.331(3) Å, β = 102.73(3)°, V = 568.1(2) Å³, Z = 2, Dc = 1.451 g cm⁻³, μ (Cu-Kα) = 9.49 cm⁻¹. Crystal dimensions 0.124 × 0.120 × 0.074 mm, 5624 reflections measured, 2199 unique (Rint = 0.0214); number of data/restraints/parameters 2199/1/211; final GoF 1.127, R = 0.0316 (2088 reflns, I>2σ(I)), wR² = 0.0841 for all data. CCDC-684313 and CCDC-684314 contain the supplementary
crystallographic data for this paper. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.
