Synthetic Part.

I. Materials and reagents

General methods. All nonhydrolytic reactions were carried out in oven-dried glassware under an inert atmosphere of dry argon or nitrogen. All commercial chemicals were used as received except solvents, which were purified and dried by means of standard methods prior to use. Analytical thin-layer chromatography (TLC) was performed on Merck 60 F254 silica gel plates (0.25mm thickness); visualization was carried out be using UV light (λ=254 and 365nm) or by spraying the plates with 5% solution of phosphomolybdic acid or ninhydrin solution followed by charring with a heat gun. Column chromatography was performed on Merck 60 silica gel (70-230 or 230-400mesh). Melting points were determined on a Thomas-Hoover apparatus and are uncorrected. NMR spectra were recorded on Bruker DPX 300 (\(^1\)H NMR at 300MHz; \(^13\)C NMR at 75MHz; \(^31\)P NMR at 121.5MHz) spectrometer. Tetramethylsilane and phosphoric acid (85%) were used as internal and external standards for \(^1\)H and \(^31\)P NMR spectra. The abbreviation “app” signifies an apparent peak or set of peaks. High-resolution mass spectra (FAB) were determined on a JMS-700 instrument at the Korea Basic Science Support Center. Optical rotations were measured with a JASCO DIP-360 digital polarimeter. The standard extractive work-up procedure consisted of pouring into a large amount of water, extracting with organic solvent indicated, washing the combined extracts successively with water and brine, drying the extract on anhydrous Na\(_2\)SO\(_4\) or MgSO\(_4\), and evaporating the solvent.

Uridine 5’-(5α-carba-α-D-N-acetylglucosaminopyranosyl diphosphate) (1)

In order to determine one-pot enzymatic synthesis, in vitro enzyme reactions were conducted in 20ml of reaction mixture including UMP (10mM), ATP (0.25mM), MgCl₂·6H₂O (20mM), acetyl phosphate (50mM), Tris-HCl (100mM, pH7.5), compound S6 (25mM) and enzyme extracts from *E. coli*. The activities of UMK (UMP kinase), ACK (Acetate kinase) and GlmU (GlcNAc-1-phosphate uridylyltransferase) were measured as previously reported. [(a) A. Matsuyama, H. Yamamoto, E. Nakano, *J. The reactions were monitored by HPLC using a strong anion exchange column (Hypersil ODS 4.6x250mm, 5μm particle size) with potassium phosphate buffer (100mM, pH7.0) : MeOH = 95 : 5 (v/v) at 270nm absorbance and a flow rate of 1.0ml/min. The reaction mixture was purified using SHIMADZU SPD-10Avp (source Q15 resin 200ml, FineLine Pilot 35 column, Kyoto chromatoco., ltd). After lyophilization, final product 1
(30mg, 23%) was obtained as white solid, and the purity of product was proved to be more than 98% by HPLC peak integration.

(1S, 2S, 3R, 4R, 5R)-2-Azido-5-(benzyloxy methyl)-3,4-(dibenzyloxy)-cyclohexane-1-acetate (S2)
To a solution of S1 [S. H. Yu, S. K. Chung, Tetrahedron:Asymmetry, 2004, 15, 581.](790mg, 1.67mmol) in pyridine (10ml) was added MsCl (0.40ml, 5.01mmol). The reaction mixture was stirred for 5 hours at RT and then worked up by a standard extractive procedure with EtOAc to provide chloromethanesulfonate compound. To a solution of CsOAc (1.20g, 5.01mmol) and 18-crown-6 (1.60g, 3.34mmol) in toluene was added this chloromethanesulfonate. The mixture was stirred and refluxed for 5 hours, then extracted with ether, dried with MgSO4, filtered, concentrated in vacuo, and purified by column chromatography to give S2 (806mg, 94.8%) as white solid.

(1S, 2S, 3R, 4R, 5R)-2-Acetamido-5-(benzyloxy methyl)-3,4-(dibenzyloxy)-cyclohexane-1-acetate (S3)
A mixture of \(S_2\) (640mg, 1.24mmol), Pd/C (120mg) and AcOH (0.078ml, 1.36mmol) in THF (10ml) was hydrogenated by using a balloon (1atm). After stirring for 15 hours at RT, the catalyst was filtered and the filtrate was evaporated. To the residue dissolved in pyridine (10ml), \(\text{Ac}_2\text{O}\) (0.529ml, 7.44mmol) was added, and the resulting solution was stirred at RT for 4 hours. The reaction mixture was subjected to the standard extraction workup using EtOAc to give the crude product, which was purified by using flash column chromatography on silica gel to afford \(S_3\) (497mg, 75.3%) as white solid.

The FLAG tagged human ncOGT was expressed in 293T cell line and immunoprecipitated using FLAG/agarose bead (Sigma, F2426). The following reagents were added: ncOGT binding bead (20μl), purified CKII protein (BioLabs P6010, 2.2μg), UDP-GlcNAc (20μM), assay buffer (25mM Hepes pH7.0, 10mM MgCl₂, 1mM EDTA) and H₂O up to 40μl. The reaction mixture was incubated for 1hour at 37°C and mixed gently at each 10 minutes. The reaction was stopped by adding SDS sample buffer (0.0642M Tris pH6.8, 10% glycerol, 2% SDS, 0.002% BPB, 5% β-mercaptoethanol). After quick centrifugation, the supernatant was subjected to SDS-PAGE and transferred to nitrocellular membrane (Hybond ECL, Amersham Biosciences, RPN303D). And then Western blot was preformed with casein kinase IIα antibody (Santa Cruz Biotechnology, Inc. Sc-12738), O-GlcNAc monoclonal antibody (CTD110.6, Covance, MMS-248R) and anti-FLAG M2 monoclonal antibody (Sigma, F3165). Westone™ solution (iNtRON biotechnology) was sprayed to the membrane and the image was analyzed by LAS-4000 (FUJIFILM corporation). The density of band was calculated by Multi-gauge V3.1 program. The amount of O-GlcNAcylation on CKIIα after OGT assay was calculated as density of band visualized by CTD110.6 was devided by densities of CKIIα and FLAG band.
