General. NMR spectra were recorded on a Varian Gemini 300 spectrometer using tetramethylsilane (TMS) as an internal reference. ESI–HRMS analyses were carried out on a JEOL JMS-T100LC mass spectrometer. IR, UV/Vis, and CD spectra were obtained by a JASCO spectrometers FT/IR-460plus, V-560, J-720WI, respectively. Melting points were determined with Yanako MP-500D and not corrected. GPC analyses were performed with Shodex K-802.5 and K-802 columns connected linearly and CHCl₃ was used as an eluent. THF was freshly distilled from sodium benzophenone ketyl before use. CH₂Cl₂ of anhydrous grade was purchased and used for evaluation of saccharide recognition with the polymer.

1-Aza-24-crown-8¹ and 2,6-diiodo-4-octyloxypyridine² (8) were prepared according to the procedures in the literature.

The Preparation of Polymer 2

Methyl 2,6-dibromo-4-pyridinecarboxylate.³ A mixture of citrazinic acid (5.0 g, 32 mmol), tetramethylammonium bromide (6.0 g, 38.5 mmol), and phosphoryl bromide (27.5 g, 96.5

S2
mmol) was stirred at 140 °C for 7 days. During the stirring, the mixture became homogeneous and then gradually solidified. After cooling to 0 °C, MeOH (25 mL) was added to the mixture, and the reaction mixture was neutralized with saturated aq NaHCO₃, extracted with CH₂Cl₂ (100 mL × 3). The combined CH₂Cl₂ extract was washed with brine and dried over Na₂SO₄ and evaporated. The resulting residue was purified by silica gel column chromatography (eluent: AcOEt/hexane = 1:4) to yield methyl 2,6-dibromo-4-pyridinecarboxylate as a colorless solid (8.2 g, 86%). The ¹H NMR spectrum was identical to that reported in the literature.³

2,6-Dibromo-4-(hydroxymethyl)pyridine (3).³ To a EtOH (400 mL) solution of methyl 2,6-dibromo-4-pyridinecarboxylate (6.3 g, 21 mmol) was added NaBH₄ (4.0 g, 110 mmol) at 0 °C, and the mixture was stirred for 3 h under reflux. After cooling to room temperature, the reaction mixture was evaporated, diluted with water (320 mL), and acidified with 1 M aq HCl (76 mL). The mixture was neutralized with Na₂CO₃ and extracted with CH₂Cl₂ (100 mL × 3). The combined CH₂Cl₂ extract was dried over MgSO₄ and evaporated. The resulting colorless solid (3, 5.7 g, 100%) was brought to the next step without further purification. The ¹H NMR spectrum was identical to that reported in the literature.³

2,6-Dibromo-4-(bromomethyl)pyridine (4). To a 1,4-dioxane (42 mL) solution of 3 (5.1 g, 19 mmol) was added PBr₃ (6.2 g, 23 mmol) at 40 °C. The mixture was stirred for 30 min at that temperature and, after removal of a heating bath, additionally stirred for 15 h. The reaction mixture was slowly poured into saturated aq NaHCO₃ (340 mL), and the aqueous mixture was extracted with CH₂Cl₂ (200 mL × 3). The combined CH₂Cl₂ extract was dried over MgSO₄ and evaporated. The resulting residue was purified by silica gel column chromatography (eluent: CH₂Cl₂) to yield 4 as a pale brown solid (5.5 g, 88%; Mp 74−76 °C; ¹H NMR (CDCl₃, 300 Hz) δ 7.47 (s, 2 H), 4.29 (s, 2 H); ¹³C NMR (CDCl₃, 75 Hz) δ 150.6, 140.8, 126.7, 28.0; IR (KBr) νₘₐₓ 3060, 3020, 2961, 1579, 1530 cm⁻¹; HRMS (ESI−TOF) calcd for C₆H₅Br₃N (M + H⁺): 329.7952; found: 329.7943.

After cooling to room temperature, the reaction mixture was evaporated and purified by silica gel column chromatography (eluent: CH₂Cl₂/MeOH = 19:1) to yield 5 (0.42 g, 100%) as yellowish brown oil. ¹H NMR (CDCl₃, 300 Hz) δ 7.56 (s, 2 H), 3.78 (s, 2 H), 3.68−3.58 (m, 28 H), 2.79 (t, J = 5.1 Hz, 4 H); ¹³C NMR (CDCl₃, 75 Hz) δ 156.0, 140.3, 126.6, 70.7, 70.4, 69.7, 57.1, 54.0; IR (neat) νₘₐₓ 2866, 1575, 1532 cm⁻¹; HRMS (ESI−TOF) calcd for C₂₂H₃₇Br₂N₂O₇ (M + H⁺): 601.0949; found: 601.0920.

Evaluation of binding affinity of 2 with glucosides. Polymer 2 \((1.0 \times 10^{-3} \text{ M, unit concentration})\), TETA \((1.7 \times 10^{-4} \text{ M})\), and TFA \((6.7 \times 10^{-4} \text{ M})\) were dissolved in CH\(_2\)Cl\(_2\) (commercially available anhydrous grade). This solution was titrated with a solution or solid of guest glucoside, and the observed ellipticity on CD was plotted versus the concentration of the glucoside. The formal binding constants were obtained by iterative curve-fitting measurements based on the equation\(^4\) and the assumption that the molecular weight of the polymer 2 was uniform in length and that the polymer and the guest associate in a 1:1 ratio.

Equation:

\[
\theta_{\text{obs}} = \frac{\theta_{11}}{2K_{11}[\mathcal{2}]_0} \left[ 1 + K_{11}[\mathcal{2}]_0 + K_{11}[\mathcal{G}]_0 - \left\{ \left( 1 + K_{11}[\mathcal{2}]_0 + K_{11}[\mathcal{G}]_0 \right)^2 - 4K_{11}^2[\mathcal{2}]_0[\mathcal{G}]_0 \right\}^{1/2} \right]
\]

\(K_{11}\): the 1:1 binding constant of 2 with glycosides

\(\theta_{\text{obs}}\): the observed ellipticity

\(\theta_{11}\): ellipticity of the 1:1 host-guest complex (at the saturation point)

\([\mathcal{2}]_0\): the total concentration of 2

\([\mathcal{G}]_0\): the total concentration of guest glycoside

Deviation was observed between plots and fitted curves possibly due to the variety of the molecular length.
