Typical procedure

[A] Typical Procedure for [2+2+2] Cycloaddition of Diyne 1a and 3,4-Pyridyne (Table 1, run 5)

An CH₂CN solution of Ni (cod)₂ (7.0 mg, 0.025 mmol, 10 mol% to 1a), PPh₃ (26.2 mg, 0.10 mmol, 40 mol% to 1a), and CsF (464.8 mg, 3.06 mmol, 3 equiv. to 2a) was stirred at room temperature for 5 min, and to the mixture was added a solution of 3,4-pyridyne precursor 2a[2] (346.5 mg, 1.02 mmol, 4 equiv. to 1a) in CH₂CN (0.5 mL). To the mixture was added a solution of diyne 1a[1] (53.0 mg, 0.25 mmol) in CH₂CN (2.0 mL) over a period of 3 h by a syringe pump at room temperature. After finishing addition of 1a, disappearance of the 1a was observed on TLC. Then the reaction mixture was quenched with 10% aqueous HCl solution, and the mixture was basified by the addition of 10% aqueous NaOH solution. The mixture was extracted with AcOEt, and the organic layer was washed with brine, and dried over Na₂SO₄. After removal of the solvent, the residue was purified by column chromatography (AcOEt) on silica gel to give isoquinoline derivative 3a (44.9 mg, 0.157 mmol, 63%) along with dimer 4aa[3] (3.7 mg, 0.009 mmol, 7%).

[B] Typical Procedure for Intramolecular [2+2+2] Cycloaddition of 5a (Table 3, run 1)

An CH₂CN solution of Ni (cod)₂ (5.5 mg, 0.02 mmol, 10 mol% to 5a), PPh₃ (10.5 mg, 0.04 mmol, 20 mol% to 5a), and CsF (91.1 mg, 0.60 mmol, 3 equiv. to 5a) was stirred at room temperature for 5 min, and to the mixture was added a solution of substrate 5a (141.1 mg, 0.20 mmol) in CH₂CN (1.5 mL) over a period of 8 h by a syringe pump at 0 °C. After finishing addition of 5a, the reaction mixture was stirred at the same temperature for 12 h. The reaction mixture was quenched with 10% aqueous HCl solution, and the mixture was basified by the addition of 10% aqueous NaOH solution. The mixture was extracted with AcOEt, and the organic layer was washed with brine, and dried over Na₂SO₄. After removal of the solvent, the residue was purified by column chromatography (AcOEt/Et₂O = 1/1) on silica gel to give isoquinoline derivative 6a (66.2 mg, 0.15 mmol, 75%).
