General Methods:

All air sensitive reactions were performed in oven dried glassware under an atmosphere of argon. Reaction solvents were dried over CaH₂ (benzene, dichloromethane), magnesium (methanol), or sodium/benzophenone ketyl (tetrahydrofuran, diethyl ether) and were distilled just prior to use. 2-Methylenetetrahydropyran¹ and 3,4-dihydro-2-methylene-2H-1-benzopyran² were prepared according to the literature procedure. Ethyl glyoxylate and 2,3-butanedione were distilled just prior to use. Ethyl glyoxylate was distilled according to the procedure of Evans.³ All other reagents were reagent grade and were purified as necessary. Analytical thin layer chromatography was performed on EM silica gel 60 F₂₅₄ glass plates (0.25 mm). Melting points were recorded using an Electrothermal melting point apparatus and are uncorrected. Flash column chromatography was performed using SiliaFlash P60 silica gel (40-63 µm) from SiliCycle, Inc. ¹H NMR spectra were recorded on a Bruker Avance DPX-300 (300 MHz) spectrometer. Chemical shifts are reported in ppm, downfield from tetramethylsilane using residual CHCl₃ (δ 7.27 ppm) or benzene (δ 7.15 ppm) as the internal standard. ¹³C NMR spectra were recorded on a Bruker Avance DPX-300 (75 MHz) spectrometer with complete proton decoupling. Chemical shifts are reported in ppm, downfield from tetramethylsilane using residual CHCl₃ as the internal standard (δ

77.0 ppm). IR spectra were obtained with a Thermo Nicolet IR-100 spectrometer on NaCl plates. Elemental analyses were performed by Complete Analysis Laboratories, Inc.; Parsippany, NJ. High resolution mass spectra were obtained using the positive ion electrospray mode on a 3-Tesla FT mass spectrometer at The Ohio State University, Columbus, OH.

**Experimental Procedures:**

**General Procedure for Three Component Coupling:** To a stirred solution of the enol ether (1.00 mmol) in 5 mL CH₂Cl₂ was added the carbonyl derivative (1.20 mmol). The resulting mixture was cooled to -78°C and titanium(IV)chloride (1.0 mL of a 1.0 M solution in CH₂Cl₂, 1.0 mmol) was added dropwise. After the time specified in Table 2, triethylsilane or allyltrimethylsilane (1.00 mmol) was added dropwise and stirring continued for 5 hours at -78°C. Saturated NaHCO₃ (2 mL) was then added carefully and the mixture was warmed to room temperature. The layers were separated and the aqueous layer was extracted with additional CH₂Cl₂ (3x). The organic layers were combined, dried over MgSO₄, filtered, and concentrated in vacuo.

Enol Ether 15: To a solution of $\delta$-octanolactone (1.38 g, 9.7 mmol) in 70 mL THF was added Cp$_2$TiMe$_2$ (39 mL of a 0.5M solution in THF, 19.5 mmol). The resulting mixture was warmed to reflux and stirred for 24 h in the dark. The solution was then cooled to room temperature, concentrated in vacuo, and the resulting residue triturated with hexanes (100 mL). The hexanes solution filtered was through celite and concentrated again. The residue was purified via flash chromatography (SiO$_2$; hexanes:triethylamine, 19:1) to afford the exocyclic enol ether 15 as a yellow oil (0.82 g, 68%).
