List of Known Compounds

The following compounds are known: lactams 1, 4. Spectra of lactams 1 and 4 are reproduced from Ref. 1.

Thionation of lactam 1

4-tert-Butyl-6-phenyl-1-azabicyclo[4.3.1]decane-10-thione (2) and 4-tert-Butyl-5a-phenyl-2,3,4,5,5a,6,7,8-octahydrothiepin[2,3-b]pyridine (3). 25 ml round bottom flask was charged with amide 1 (0.0200 g, 0.07 mmol, 1.0 equiv), P₄S₁₀ (0.0080 g, 0.018 mmol, 0.25 equiv) and toluene (5.0 mL). Thionation of the bridged and the fused amide with Lawesson’s reagent

25 ml round bottom flask was charged with amide 1 (0.0200 g, 0.070 mmol, 1.0 equiv) Lawesson’s reagent (0.0871 g, 0.21 mmol, 3.0 equiv), and toluene (7.0 mL), and the resulting mixture was heated to reflux for 24 h. After the reaction was cooled to rt, the solvent was removed and the reaction was analyzed by NMR. $^1$H NMR indicated 31:6:63 mixture of 1:2:3. Note: the use of Lawesson’s reagent complicates the purification of the final products; the lactams exhibit similar polarity to the decomposition products of the thionating reagent.

8-tert-Butyl-9a-phenylhexahydro-1H-pyrrolo[1,2-a]azepine-5(6H)-thione (5). According to the procedure described above, the reaction of amide 4 (0.0500 g, 0.175 mmol, 1.0 equiv), Lawesson’s reagent (0.11 g, 0.26 mmol, 1.5 equiv) in toluene (7.0 mL) at reflux for 30 min, afforded after solvent removal and chromatography (1/10-1/4 EtOAc/hexanes), the title compound as white solid (m.p. = 152-3 °C, $R_f = 0.73$, 1/1 EtOAc/hexanes). Yield 93% (0.0488 g, 0.0162 mmol). $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ 0.92 (s, 9H), 1.22-1.38 (m, 2H), 1.43-1.52 (m, 1H), 1.64 (dd, $J = 2.8$, 10.8 Hz, 1H), 1.73-1.82 (m, 1H), 2.01 (m, 1H), 2.26 (m, 2H), 2.46 (d, $J = 13.6$ Hz, 1H), 2.60 (td, $J = 6.1$, 12.8 Hz, 1H), 2.99 (ddd, $J = 1.8$, 5.0, 12.4 Hz, 1H), 2.87-3.97 (m, 1H), 4.09 (dd, $J = 4.8$, 9.2 Hz, 1H), 7.12 (d, $J = 7.4$ Hz, 2H), 7.29 (t, $J = 7.2$ Hz, 1H), 7.36 (t, $J = 7.7$ Hz, 2H); $^{13}$C NMR (100 MHz, CDCl$_3$) $\delta$ 19.8, 26.8, 27.0, 32.6, 39.6, 41.3, 42.7, 44.1, 56.0, 75.4, 124.8, 127.3, 128.7, 145.4, 200.5; IR (neat) 2950, 2916, 2868, 1470, 1443, 1367, 1331, 1252, 1148 cm$^{-1}$; HRMS calcd for C$_{19}$H$_{28}$NS (M$^+$ + H) 302.1942, found 302.1953.
Alternative Mechanism for Rearrangement of 2 to 3

In an alternative mechanism, phosphonodithioic acid (generated from P₄S₁₀ or Lawesson’s reagent and traces of moisture, as shown below in equation 1, Scheme A) could protonate bridged thioamide bond. However, as noted by Curphey, phosphorus pentasulfide and its thiophosphates are strong electrophiles and at present we cannot distinguish between the activation modes of 2. We also note that reactions with bridged amide 1 were carried out with rigorous exclusion of moisture.

Secondly, it is possible that the electrophilic activation of bridged thioamide 2 occurs at sulfur instead of nitrogen. Although a typical thioamide bond would be expected to undergo protonation at sulfur, in analogy to bridged amides with [4.3.1] ring system which due to the non-planarity of amide bonds are protonated at nitrogen rather than oxygen, we proposed that 2 would also undergo electrophilic attack at nitrogen. We note that there are no examples of bridged thioamides described in literature. Accordingly, the reactivity profile of species analogous to 2 is currently unknown. Study to address the intriguing question of reactivity of bridged thioamides is underway in our laboratories.
