Facile EG/Ionic Liquid Interfacial Synthesis of Uniform RE$^{3+}$ Doped NaYF$_4$ Nanocubes

_Chang Zhang and Ji Chen*

Supporting Information

Experimental Section

Preparation of [C$_8$mim]PF$_6$. 1-Chlorooctane, 1-methylimidazole and KPF$_6$ were used to synthesize the IL via the reference method$^{1,2}$ and they were examined by $^1$H NMR, $^{13}$C NMR, and IR. Their water contents after synthesis were measured by the Karl Fischer technique.

Preparation of RE$^{3+}$ doped NaYF$_4$ nanocubes. In a typical synthesis, 0.10 mmol RE nitrate and 0.10 mmol sodium nitrate were dissolved in 1.5 mL of ethylene glycol solution under ultrasonic conditions. Then the above solution was transferred into a 15mL polytetra-fluoroethylene (PTFE) vial that containing 9 mL of [C$_8$mim]PF$_6$ to form a biphasic system. Finally, the vial was sealed and kept at 80°C for 24 h. After cooling to the room temperature naturally, transparent plate-like ionogels can be found on the bottom of the vial. Then they were washed by ethanol and deionics water several times under ultrasonic conditions, collected by centrifugation and dried under vacuum at 70 °C for 12h.

Characterizations. $^1$H and $^{13}$C NMR spectra were collected on a Bruker Advance DRX400 spectrometer. Fourier transform infrared (FT-IR) spectra were collected at room temperature with a Bruker IFS 66 V instrument. The morphology and size of the as-synthesized products were observed under a scanning electron microscope (Hitachi S-4800). High resolution transmission electron microscopy (HRTEM) images were recorded using a FEI Tecnai G2 F20 at 200 kV. The structure and phase purity of the as-synthesized samples were determined using X-ray diffraction (XRD) analysis on a Bruker AXS D8 Advance Powder X-ray diffractometer (using CuKR radiation: $\lambda=1.5418\text{Å}$ ). The upconversion emission spectra were obtained using a 980 nm laser from an OPO (optical parametric oscillator, Continuum Sunlite, USA) as the excitation source and detected by R955 (HAMAMATSU).
