Photochemical Isomerisation of Boryl-Substituted Silole Derivatives

Juri Ugolotti, Gerald Kehr, Roland Fröhlich, Gerhard Erker

Organisch-Chemisches Institut, Westfälische Wilhelms-Universität, Corrensstrasse 40, 48149 Münster, Germany.

Supporting Information
**General Procedures.** Reactions with air- and moisture sensitive compounds were carried out under an argon atmosphere using Schlenk-type glassware or a glovebox. Solvents were dried with the procedure reported by Grubbs (Pangborn, A. B.; Giardello, M. A.; Grubbs, R. H.; Rosen, R. K.; Timmers, F. J. *Organometallics*, 1996, 15, 1518-1520) or, particularly deuterated solvents, were distilled from appropriate drying agents and stored under an argon atmosphere. The following instruments were used for physical characterization of the compounds: NMR: Varian Inova 500 (¹H: 500 MHz; ¹¹B: 161 MHz; ¹³C: 126 MHz; ¹⁹F: 470 MHz; ²⁹Si: 99 MHz {using INEPT pulse sequence based on $J_{Si,H} = 7$ Hz}). Most NMR assignments were supported by additional 2D experiments. The IR spectra were obtained with a Varian 3100 FT-IR (EXCALIBUR Series) spectrometer, the MS GC-EI with Triplequad TSQ (Thermo-Finnigan-MAT, Bremen). Elemental analyses were performed with a Foss-Heraeus CHN-O-Rapid instrument. Irradiation: Pyrex filtered UV light Philips-Hg-high pressure lamp (125 W: HPK 125).

Trimethylsilylethynyllithium (3.5 g, 33.6 mmol) was dissolved under argon in 100 mL diethylether in a 300 mL Schlenk flask with stirring. The flask was then cooled to -30 °C, and dichlorodimethylsilane (2.4 mL, 24.5 mmol) was added to the cold solution with a syringe, under argon. The white suspension was stirred at low temperature for 1 hour and at room temperature overnight. Filtration over celite afforded a colourless liquid that was purified by distillation (60 °C, 10⁻¹ mbar). Isolated yield = 57% (2.45 g). The product crystallized on standing, forming crystals suitable for X-ray diffraction.

50% probability of thermal ellipsoids
3-[Bis(pentafluorophenyl)boryl]-2,5-bis(trimethylsilyl)dimethylsiloole (3a).
Bis(trimethylsilylethynyl)dimethylsilane (1a) (438 mg, 1.734 mmol), and bis(pentafluorophenyl)borane (600 mg, 1.734 mmol), were weighed in an argon-filled glove-box and put into a 300 mL Schlenk flask. Toluene (100 mL) was added at room temperature by cannula under argon and the resulting bright yellow solution was stirred overnight. The day after, the volatiles were removed under high vacuum leaving a yellow oily product. The product was washed with pentane (3x30 mL), and no further purification was performed. Yield 78% (815 mg).

5-[Bis(pentafluorophenyl)boryl]-2,3-bis(trimethylsilyl)-diphenylsilole (4b)

3-[Bis(pentafluorophenyl)boryl]-2,5-bis(trimethylsilyl)-diphenylsilole (3b) (250 mg, 0.346 mmol) was dissolved by 10 mL toluene in a 50 mL Schlenk flask under argon with stirring, and the flask was irradiated with UV lamp for 2 hours. The volatiles were then removed and the yellow product washed with pentane (1x10 mL). Isolated yield 71% (569 mg).

5-[Bis(pentafluorophenyl)boryl]-2,3-bis(trimethylsilyl)-4-pentafluorophenyl-diphenylsilole (5)

Bis(trimethylsilylethynyl)diphenylsilane (1b) (294 mg, 0.780 mmol), and tris(pentafluorophenyl)borane (400 mg, 0.781 mmol), were weighed under argon in a 100 mL Schlenk flask and dissolved by 30 mL toluene. After 2 hours stirring at room temperature, the flask was irradiated with UV lamp for 6 hours in order to achieve complete isomerisation. During irradiation, the solutions turned from pale-yellow to bright-green. After irradiation the volatiles were removed by vacuum and the green sticky product was washed with pentane (1x10 mL). Isolated yield 58% (402 mg).
