Experimental Details and Synthesis of the Complexes

Scientific Equipment. C, H and N analyses were carried out in a Perkin-Elmer 2400 CHNS/O analyzer. NMR spectra were recorded on Bruker Avance 300 MHz spectrometers. $^1$H (300.13 MHz), $^{31}$P{$^1$H} (121.48 MHz) and $^{13}$C{$^1$H} (75.48 MHz) NMR chemical shifts are reported in ppm relative to tetramethylsilane and referenced to partially deuterated solvent resonances for $^1$H and $^{13}$C, and H$_3$PO$_4$ (85%) for $^{31}$P. Coupling constants ($J$) are given in Hertz. Conductivities were measured in ca. 5 $10^{-4}$ M acetone solutions of the complexes using a Philips PW 9501/01 conductimeter. Electrospray mass spectra (ESI-MS) were recorded in methanol on a Bruker MicroTof-Q using sodium formiate as reference. MALDI-Tof mass spectra were obtained on a Bruker Miocroflex mass spectrometer using DCTB (trans-2-[3-(4-tert-butylphenyl)-2-methyl-2-propenylidene]malononitrile) or dithranol as matrix. FT-IR spectra were collected on a Nicolet Nexus 5700 FT spectrophotometer equipped with a Nicolet Smart Collector diffuse reflectance accessory.
Organic compounds were identified by Gas Chromatography-Mass Spectrometry (GC-MS) recorded in the mass range 1-1000 m/z on a Agilent 6890 GC-Agilent 5973 MS, equipped with a polar capillary column HP-5MS (30m x 0.25 mm d.i. x 0.25 µm). The catalytic reactions were analyzed on a GC HP 6890N with an ionization detector fitted up to a HP Ultra-1 (25m x 0.32 mm d.i. x 0.17 µm). Calibration was made with the internal standard tetradecane.

**Synthesis.** All experiments were carried out under an atmosphere of argon using Schlenk techniques. Solvents were obtained from a Solvent Purification System (Innovative Technologies). CDCl₃, CD₂Cl₂, THF-δ₈ (Euriso-top) were dried using activated molecular sieves. Standard literature procedures were used to prepare the starting materials \([\text{Rh}(\mu-\text{Cl})(\text{cod})]_2\)^i and \([\text{Rh}(\mu-\text{Cl})(\text{coe})]_2\)^ii. The functionalized ether phosphine (3-ethoxypropyl)diphenylphosphine, Ph₂P(CH₂)₃OEt, was prepared following published methodsiii

**Synthesis of [Rh(cod)(Ph₂P(CH₂)₃OEt)]BF₄ (1).** A suspension of \([\text{Rh}(\mu-\text{Cl})(\text{cod})]_2\) (246 mg, 0.500 mmol) in acetone (10 mL) at 0 ºC was treated with AgBF₄ (194 mg, 1.00 mmol). The AgCl formed was removed by filtration and the resulting yellow solution was poured into a solution of Ph₂P(CH₂)₃OEt (272 mg, 1.00 mmol) in acetone (3 cm³) at 0 ºC and stirred for 40 min. The solvent was removed under vacuum and the crude compound was dissolved in acetone (2 cm³) and layered with diethyl ether (10 cm³) at room temperature for 12 h to give the compound 1 as yellow crystals, which were filtered off, washed with diethyl ether (2 x 5 cm³), and dried in vacuo (353 mg, 62%); Anal. Found: C, 52.89; H, 5.10. C₂₅H₃₃BF₄OPRh requires C, 52.66; H, 5.83); δH (300.13 MHz; 298 K; CDCl₃; Me₄Si): 7.61–7.43 (10H, m, 2 x Ph), 5.22 (2H, br, =CH cod), 4.04 (2H, m, CH₂), 3.44 (2H, q, J 7.2, CH₂CH₃), 3.19 (2H, br, =CH cod), 2.68 (2H, m, CH₂), 2.58–2.42 (4H, m, CH₂ cod), 2.08–1.18 (6H, m, CH₂ cod and CH₂), 1.04 (3H, t, J 7.2, CH₂CH₃); δP (121.48 MHz; 298 K; CDCl₃; H₃PO₄): 20.69 (d, Jₚ-Rh 147.6); δC (75.48 MHz; 298 K; CDCl₃; Me₄Si): 132.81 (d, Jₐ-P 10.7, C₀), 131.23 (d, Jₐ-P 2.1, Cₖ), 129.30 (d, Jₐ-P 40.5, Cₐ),
Synthesis of \([\text{Rh(cod)}(\text{Ph}_2\text{P(CH}_2_3\text{OEt})\text{(PPh}_3)]\text{BF}_4 \ (2)\). To a yellow solution of \([\text{Rh(cod)}\{\text{Ph}_2\text{P(CH}_2_3\text{OEt)}\}]\text{BF}_4 \ (1)\) (100 mg, 0.170 mmol) in dichloromethane (5 cm\(^3\)) a solution of PPh\(_3\) (44.6 mg, 0.170 mmol) in the same solvent (2 cm\(^3\)) was added slowly and the resulting solution was stirred for 30 min. The solution was concentrated under vacuum at ca. 1 cm\(^3\) and the slow addition of diethyl ether gave the compound 2 as a yellow solid that was filtrated, washed with diethyl ether (2 x 5 cm\(^3\)) and dried in vacuo (141 mg, 84%; Anal. Found: C, 62.84; H, 5.98. S-2 General Procedure for Hydroamination Catalytic Experiments. The catalytic
hydroamination reactions were carried out under an argon atmosphere in a thick glass reaction
tube fitted with a greaseless high-vacuum stopcock. In a typical experiment, the reactor was
charged with a solution of the catalyst (0.020 mmol) in THF (2 cm³), 2 mg of molecular sieves in
powder (4Å) and the reactants in the following order: piperidine (0.800 mmol, 79 µL),
tetradecane as internal standard (0.350 mmol, 91 µL) and styrene (3.24 mmol, 371 µL). The
mixture was stirred at room temperature until the catalyst was completely dissolved, and then
placed in an thermostatized oil bath at the required temperature.

The yield and selectivity were determined by GC analysis under the following conditions:
Initial T° 50°C for 4 min, ramp 15°/min, and final T° 250° for 10 min.
