General information: Unless otherwise stated, all commercial reagents and solvents were used without additional purification, and all reactions were performed under nitrogen atmosphere in dried glassware. All solvents and Et3N were dried and distilled according to standard procedures. Analytical thin layer chromatography (TLC) was performed on Merck precoated silica gel 60 F254 plates. Visualization on TLC was achieved by the use of UV light (254 nm) and treatment with phosphomolybdic acid or ceric ammonium molybdate stain followed by heating. Column chromatography was undertaken on silica gel (Merck Kieselgel 60 F254 400-630 mesh). 1H NMR was recorded on Bruker FT AM 400 (400 MHz) or Varian Inova 400 (400 MHz). Chemical shifts are quoted in parts per million (ppm) referenced to the appropriate solvent peak or 0.0 ppm for tetramethylsilane. The following abbreviations were used to describe peak splitting patterns when appropriate: br = broad, s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet. Coupling constants, \( J \), were reported in hertz unit (Hz). 13C NMR was recorded on Bruker FT AM 400 (100 MHz) or Varian Inova 400 (100 MHz) and was fully decoupled by broad band proton decoupling. Chemical shifts were reported in ppm referenced to the center line of a triplet at 77.0 ppm of chloroform-d. Infrared (IR) spectra were recorded neat in 0.5 mm path length using a sodium chloride cell on Bruker EQUINOX 55. Frequencies are given in reciprocal centimeters (cm\(^{-1}\)) and only selected absorbance is reported. Melting points were measured with a Barnstead Electrothermal apparatus (12V, ~50/60Hz, 45W Fuse, made in UK). High resolution mass spectra were obtained from the Korea Basic Science Institute (Daegu) by using EI or FAB methods.

Representative procedure for the synthesis of α-functionalized imidates (Table 1, 2 and 3). To a mixture of CuI (9.5 mg, 0.05 mmol), \( p \)-toluenesulfonyl azide \(^1\) (118.3 mg, 0.60 mmol) and \( \text{trans-\textbeta-} \) nitrostyrene (75 mg, 0.50 mmol) in THF (1.5 mL) was slowly added phenylacetylene (66 \( \mu \)L, 0.60 mmol) methanol (101 \( \mu \)L, 2.5 mmol) and triethylamine (208 \( \mu \)L, 1.5 mmol) at room temperature under an \( \text{N}_2 \) atmosphere. After 24 h, the reaction mixture was diluted with \( \text{CH}_2\text{Cl}_2 \) (3 mL) and quenched with a sat. \( \text{NH}_4\text{Cl} \)-solution (3 mL) and a 1N HCl-solution (3 mL). The mixture was stirred for an additional 30 minutes and then the layers were separated. The aqueous phase was extracted with \( \text{CH}_2\text{Cl}_2 \) (3 x 6 mL). The combined organic layers were dried over \( \text{MgSO}_4 \), filtered and concentrated \textit{in vacuo}. The residue was purified by column chromatography using silica gel with \( n \)-hexane/ethyl acetate = 5/1 as eluent to afford the desired product.

Reaction profile for the four-component reaction. To a mixture of CuI (3.8 mg, 0.02 mmol) and trans-β-nitrostyrene (30.1 mg, 0.20 mmol) in THF (0.6 mL) was slowly added phenylacetylene (26.9 µL, 0.24 mmol), p-toluenesulfonyl azide (36.4 µL, 0.24 mmol), methanol (40.6 µL, 1.00 mmol) and triethylamine (84.0 µL, 0.60 mmol) at room temperature under an N₂ atmosphere (Scheme S1).

Scheme S1

After various reaction times, the reaction mixture was diluted with CH₂Cl₂, quenched with sat. NH₄Cl and 1N HCl, and stirred for an additional 10 min. The combined organic layers were dried over MgSO₄, filtered and concentrated in vacuo.

The yield of the reaction was monitored by ¹H NMR using an internal standard (1,1,2,2-tetrachloroethane) in the periods of 30 min, 1 h, 2 h, 3 h, 4 h, 6 h, 8 h, 10 h, 12 h, 20 h and 24 h. The results are presented in Figure S1. It was found that the three-component product B was observed prior to the four-component product A.

**Reaction profile for the reaction of trans-β-nitrostyrene with pre-formed imidate.** Preparation of pre-formed imidate: To a mixture of CuI (0.190 g, 1.0 mmol) in CHCl₃ (20 mL) was slowly added phenylacetylene (1.1 mL, 10 mmol), p-toluenesulfonyl azide (1.8 mL, 12 mmol), methanol (0.5 mL, 12 mmol) and triethylamine (1.7 mL, 12 mmol) at room temperature under an N₂ atmosphere. After 12 h, the reaction mixture was diluted with CH₂Cl₂, quenched with sat. NH₄Cl-solution, and stirred for an additional 30 min. The aqueous layer was extracted with CH₂Cl₂ (3x). The combined organic layers were dried over MgSO₄, filtered and concentrated in vacuo. The residue was purified by column chromatography using silica gel with n-hexane/ethyl acetate = 5/1 as eluent to afford the desired product.

Synthesis of four-component product from pre-formed imidate: To a mixture of CuI (3.8 mg, 0.02 mmol), trans-β-nitrostyrene (30.1 mg, 0.20 mmol), and imidate (72.8 mg, 0.24 mmol) in THF (0.6 mL) was slowly added triethylamine (84.0 µL, 0.60 mmol) at room temperature under an N₂ atmosphere (Scheme S2).

After various reaction times, the reaction mixture was diluted with CH₂Cl₂, quenched with sat. NH₄Cl-solution and 1N HCl-solution, and stirred for an additional 10 min. The aqueous layer was extracted with CH₂Cl₂ (3x). The combined organic layers were dried over MgSO₄, filtered and concentrated in vacuo.
The yield of the reaction was monitored by $^1$H NMR using an internal standard (1,1,2,2-tetrachloroethane) in the periods of 30 min, 1 h, 2 h, 3 h, 4 h, 6 h, 8 h, 10 h, 12 h, 20 h and 24 h. The results are presented in Figure S2.
