The calculation of standard ammonia electrolysis voltage

The standard ammonia electrolysis voltage is calculated here according to reaction (S1),

\[ \frac{1}{2}N_2 (g) + \frac{3}{2}H_2 (g) \leftrightarrow NH_3 (l) \quad (S1). \]

The voltage difference between anode electrode ($E_{N_2}$) and cathode electrode ($E_{H_2}$) is described by the Nernst’s equation as follows,

\[ E_{N_2} - E_{H_2} = -\frac{\Delta G^0}{3F} + RT \ln \left( p_{N_2}^{1/2} p_{H_2}^{3/2} / 3F \right) \quad (S2) \]

where $F$ is the Faraday constant and $R$ is gas constant. Standard Gibbs free energy change ($\Delta G^0$) of reaction (S1) is $-10.984 \text{ kJ/mol NH}_3$ from the enthalpy of formation: $\Delta H_f (\text{liquid NH}_3) = -67.2 \text{ kJ/mol}^1$ and the entropies: $S^0 (\text{liquid NH}_3) = 103.3 \text{ J/mol \ K}^1$, $S^0 (\text{H}_2) = 130.7 \text{ J/mol}^2$ and $S^0 (\text{N}_2) = 191.6 \text{ J/mol}^2$. Hydrogen pressure ($p_{N_2}$) and nitrogen pressure ($p_{N_2}$) should be equivalent to the equilibrium ammonia vapor pressure ($p_{NH_3}$) of liquid ammonia, because the gas is released with working for solution pressure by the ammonia vapor pressure in the closed liquid ammonia system. The $p_{NH_3}$ at 298.15 K is 9.9 atm.\textsuperscript{3} So the second term of 0.039 V is almost equal to the first term of 0.038 V. It indicates that the pressure change largely affects to the ammonia electrolysis voltage. Finally the standard ammonia electrolysis voltage is determined to be 0.077 V.

Energy consumption of hydrogen generation, storage and supply

Liquid ammonia is comparable to the pressurized hydrogen in point of energy consumption of hydrogen generation, storage and supply to fuel cell or combustion engine. For liquid ammonia the energy consumption of ammonia production from natural gas as a feedstock is 28.5 MJ/kgNH$_3$ based on a lower heating value (LHV).\textsuperscript{4} The energy consumption of hydrogen supply from liquid ammonia by the electrolysis is 7.4 MJ/kgH$_2$, which is calculated by using the standard voltage of ammonia electrolysis. The total energy consumption is expressed as follows,

\[ E_{\text{total [liquid ammonia]}} = E (\text{ammonia production}) + E (\text{ammonia electrolysis}) \]

\[ = 160.5 \text{ MJ/kgNH}_3 + 7.4 \text{ MJ/kgH}_2 = 167.9 \text{ MJ/kgH}_2 \quad (S3) \]
Therefore the total energy efficiency for liquid ammonia is 71 % by using the energy in hydrogen (120 MJ/kgH₂ (LHV)).

For pressurized hydrogen the energy consumption of hydrogen production from natural gas as the feedstock is 183.2 MJ/kgH₂ (LHV) \(^5\) and that of hydrogen compression to 70 MPa is 18 MJ/kgH₂ \(^6\). The total energy consumption is described as follows,

\[
E_{\text{total}} \text{[pressurized hydrogen]} = E \text{ (hydrogen production)} + E \text{ (hydrogen compression)}
\]

\[
= 183.2 \text{ MJ/kgH}_2 + 18 \text{ MJ/kgH}_2 = 201.2 \text{ MJ/kgH}_2 \quad (S4)
\]

The total energy efficiency for pressurized hydrogen is 60 %.

The current efficiency
The current efficiency of potentiostatic electrolysis for liquid ammonia with 1 M KNH₂ is estimated to 85 % according to equation (S5),

\[
\text{Current efficiency} = \frac{\text{released hydrogen based on pressure increase (mol)}}{\text{released hydrogen based on electric charge (mol)}} \quad (S5).
\]

For released hydrogen based on pressure increase, the cell pressure increases 0.523 MPa from 0.963 to 1.486 MPa during the electrolysis at 2 V of cell voltage for 10h as shown in Figure S3. Partial hydrogen pressure is 0.391 MPa from the ratio of H₂ to N₂ (2.960) determined by GC measurement. Therefore the released hydrogen amount is estimated to 4.62×10⁻³ mol by using 298 K of measurement temperature and 29.35 cm³ of the cell volume subtracted liquid ammonia and KNH₂ volume. For released hydrogen based on electric charge, the total amount of charged electron is 1.09 \times 10^{-2} mol by integrating the chronoamperometry line of Figure 3. Since the mole ratio of released hydrogen to charged electron is half based on reaction (3), released hydrogen amount is estimated to 5.46×10⁻³ mol.
