**Instrumentation and Chemicals**

All manipulations of oxygen- and moisture-sensitive materials were conducted in a dry box or with a standard Schlenk technique under a purified argon atmosphere. Nuclear magnetic resonance spectra were taken on Varian UNITY INOVA 500 (\(^1\)H, 500 MHz; \(^{13}\)C, 125.7 MHz) spectrometer using tetramethylsilane (\(^1\)H) as an internal standard. \(^1\)H NMR data are reported as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, quint = quintet, sext = sextet, sept = septet, br = broad, m = multiplet), coupling constants (Hz), integration, and identification. High-resolution mass spectra were obtained with a Thermo Fisher SCIENTIFIC EXACTIVE spectrometer. Preparative recycling gel permeation chromatography (GPC) was performed with JAI LC-908 equipped with JAIGEL-1H and -2H columns (toluene as an eluent). Infrared spectra (IR) spectra were determined on a SHIMADZU IR Affinity-1 spectrometer. Melting points were determined using a YANAKO MP-500D. TLC analyses were performed by means of Merck Kieselgel 60 F\(_{254}\) (0.25 mm) Plates. Visualization was accomplished with UV light (254 nm) and/or an aqueous alkaline KMnO\(_4\) solution followed by heating. Flash column chromatography was carried out using Kanto Chemical silica gel (spherical, 40–50 \(\mu\)m). Unless otherwise noted, commercially available reagents were used without purification. 1,4-Dioxane was purchased from Wako Pure Chemical Co. stored over slices of sodium. Bis(1,5-cyclooctadiene)nickel and 1,3-bis(2,6-diisopropylphenyl)imidazol-2-ylidene were purchased from Strem Chemicals, Inc.
**Experimental Procedure and Characterization Data for Products.**

**General procedure.** The reaction was performed in a 15 mL sealed tube equipped with a Teflon-coated magnetic stirrer bar. A isocyanate (0.25 mmol), alkyne (1.0 mmol) and acrylate (0.25 mmol) were added to a solution of bis(1,5-dicyclooctadiene)nickel (7 mg, 0.025 mmol) and 1,3-bis(2,6-diisopropylphenyl)imidazol-2-ylidene (10 mg, 0.025 mmol) in 1,4-dioxane (1 mL) in a dry box. The flask was taken outside the dry box and heated at 100 °C for the indicated time under argon atmosphere. The resulting reaction mixture was cooled to ambient temperature and filtered through a silica gel pad, concentrated in vacuo. The residue was purified by flash silica gel column chromatography (20 g, 2x15 cm, hexane/ethyl acetate = 3:1) to give the corresponding product.
