Experimental Section

General

Commercial available solvents and reagents were used as received. Deuterated solvents for NMR measurements were available from Aldrich. UV-Vis absorption spectra were recorded by a Varian Cary 100 spectrophotometer and fluorescence spectra were recorded on a Varian Cray Eclipse fluorescence spectrophotometer, with a quartz cuvette (path length = 1 cm); both spectrophotometers were standardized. ^1H NMR and ^13C NMR spectra were obtained using a Bruker AM 400 spectrometer with tetramethylsilane (TMS) as the internal standard. Mass spectra (MS) were carried out on an TOF MS instrument. Column chromatography was carried out in air using silica gel (200-300 mesh). Reactions were monitored by thin-layer chromatography. PD2,3 PD3,3 D1,3a and D4,3b were prepared according to reported methods.

Scheme S1 Synthesis of sensors D2 and D3.

Preparation of compound (D2).3c PD2 (340 mg, 1 mmol) was dissolved in 250 mL of CH2Cl2, then DDQ (340 mg, 1.5 mmol) was added. The mixture was stirred at room temperature for 30 min and then directly purified by silica gel column (Eluent: CH2Cl2 : PE=1:1) to afford the crude product D2 which was recrystallized from CH2Cl2 and n-hexane (251 mg, yield: 74.2%). ^1H NMR (CDCl3, Bruker 400 MHz, 298K): δ 12.76 (b, 1H, CHO-H), 9.72 (s, 1H, Pyrrolic-NH), 8.16 (s, 1H, Pyrrolic-αH), 6.90 (d, 1H, J=4.4 Hz, Pyrrolic), 6.71 (d, 1H, J=4.8 Hz, Pyrrolic), 6.65 (d, 1H, J=4.8 Hz, Pyrrolic), 6.26 (d, 1H, J=4.0 Hz, Pyrrolic). ^13C NMR (CDCl3, Bruker 100 MHz, 298K):
δ 180.49, 163.74, 153.16, 139.27, 136.07, 133.60, 128.51, 119.91, 119.65. HRMS: obsd 339.0562, calcd for C16H8F5N2O ([M+H⁺]: 339.0557.

Preparation of compound (D3). 3c PD3 (500 mg, 1.2 mmol) was dissolved in 300 mL of CH2Cl2, then DDQ (409 mg, 1.8 mmol) was added. The mixture was stirred at room temperature for 1 h and then directly purified by silica gel column (Eluent: CH2Cl2) to afford the crude product D3 which was recrystallized from CH2Cl2 and n-hexane (205 mg, yield: 41.2%). 1HNMR: (CDCl3, Bruker 400 MHz, 298K): δ 12.89 (s, 1H, pyrrolic-NH), 8.16 (s, 1H, pyrrolic), 7.93 (t, 2H, Ph-H), 7.59 (t, 1H, Ph-H), 7.5 (t, 2H, Ph-H), 6.8 (d, 1H, J = 4.0 Hz, pyrrolic), 6.71(d, 1H, J = 4.4 Hz, pyrrolic), 6.64 (d, 1H, J = 4.8 Hz, pyrrolic), 6.27 (d, 1H, J = 4.0 Hz, pyrrolic). 13C NMR (CDCl3, Bruker 100 MHz, 298K): δ 185.10, 163.39, 152.76, 138.49, 137.88, 135.28, 133.44, 132.38, 129.08, 128.47, 128.13, 122.36, 119.63, 119.23. HRMS: obsd 415.0874, calcd for C22H12F5N2O ([M+H⁺]: 415.0870.

Sensor D4 applied in aqueous solution

In order to test sensor D4 as a potential biological fluorescent sensor, we investigated its performance in aqueous solution. All measurements were carried out in HEPES buffer (DMF/50mM HEPES, 1:4, v:v, pH 7.2). The concentration of sensor D4 was fixed at 1×10^{-5} M. As shown in Figure S7a, the binding behavior is similar to that observed in DMF. Upon addition of Zn^{2+} (0–1.2 eq.), the peak centered at 528 nm decreases gradually with a new sharp peak developed at about 616 nm. D4 shows weak fluorescence, but the fluorescence intensity was greatly enhanced with a maximal emission at 629 nm upon addition of Zn^{2+} (Fig. S7b). When various metal ions were added respectively to the solution of D4, only Zn^{2+} greatly enhanced its fluorescence intensity (Fig. S7c). These results suggest that D4 is a promising candidate for biological imaging. Competition experiments also give inspiring results as shown in Figure S7d, with the fluorescence intensity almost unaffected by other ions. All these results prompted us to further investigate its possible applications in bioimaging.

Crystallography

Single crystals suitable for X-ray analysis of [Zn(D2)2], [Zn(D3)2]·MeOH and [ZnD4(H2O)2]·2MeOH were obtained by slow evaporation of a MeOH·H2O solution of the corresponding zinc complex at room temperature.

Crystal data for [Zn(D2)2]: C_{32}H_{12}F_{10}N_{4}O_{2}Zn, Mw = 739.83 g·mol⁻¹, 0.48 × 0.46 × 0.21 mm³, Monoclinic, C2/c, a = 56.690(5), b = 7.6550(8), c = 13.1551(12) Å, β = 92.7360(10)°, V = 5702.3(9) Å³, F(000) = 2944, ρ_{calcd} = 1.724 Mg·m⁻³, μ(Mo-Kα) = 0.967 mm⁻¹, T = 298(2) K, 13570 data were measured on a Bruker SMART Apex diffractometer, of which 5012 were unique (R_{int} = 0.0655); 442 parameters were refined against F{2} (all data), final wR² = 0.1570, S = 1.081, R1 (I > 2σ(I)) = 0.0729, largest final difference peak/hole = +0.615/−0.926 e Å⁻³. Structure solution by direct methods and full-matrix least-squares refinement against F{2} (all data) using SHELXTL.

[Zn(D3)2]·MeOH: C_{45}H_{24}F_{10}N_{4}O_{3}Zn, Mw = 924.05 g·mol⁻¹, 0.22 × 0.16 × 0.12 mm³, Monoclinic, C2/c, a = 28.864(2), b = 10.2060(10), c = 14.8521(13) Å, β = 115.894(2)°, V = 3936.0(6) Å³, F(000) = 2944, ρ_{calcd} = 1.724 Mg·m⁻³, μ(Mo-Kα) = 0.967 mm⁻¹, T = 298(2) K, 9831 data were measured on a Bruker SMART Apex diffractometer, of which 3460 were unique (R_{int} = 0.0812); 290 parameters were refined against F{2} (all data), final wR² = 0.1570, S = 1.081, R1 (I > 2σ(I)) = 0.0729, largest final difference peak/hole = +0.487/−0.344 e Å⁻³. Structure solution by direct methods and full-matrix least-squares refinement against F{2} (all data) using SHELXTL.

[ZnD4(H2O)2]·2MeOH: C_{28}H_{19}F_{10}N_{3}O_{5}Zn, Mw = 732.83 g·mol⁻¹, 0.40 × 0.34 × 0.14 mm³, Orthorhombic, P2(1)2(1)2(1), a = 7.5070(8), b = 16.0921(17), c = 49.020(4) Å, β = 90°, V = 5921.8(10) Å³, F(000) = 2944, Dc = 1.644 Mg·m⁻³, μ(Mo-Kα) = 0.936 mm⁻¹, T = 298(2) K, 29656 data were measured on a Bruker SMART Apex diffractometer, of which 10345 were
unique (\(R_{int} = 0.1375\)); 852 parameters were refined against Fo\(^2\) (all data), final wR2= 0.3127, S= 1.047, R1 (I > 2σ(I))= 0.1298, largest final difference peak/hole = +0.912/–0.891 e Å\(^{-3}\). Structure solution by direct methods and full-matrix least-squares refinement against F\(^2\) (all data) using SHELXTL.

**DFT calculations**

All calculations were carried out by using the Gaussian03 program package.\(^4\) The geometries of all compounds were optimized by density functional calculations employing the hybrid B3LYP function.\(^5\) The LANL2DZ basis set\(^6\) was used for Zn atom while the 6-31G* basis set\(^7\) was adopted to describe other atoms. Subsequent single-point calculations were performed with the same method and basis sets, but in a DMF solvent environment\(^8\) represented by the polarizable continuum model. The calculated HOMO/LUMO energies are listed in Table S2. Molecular structures and molecular orbitals were visualized by the Gabedit software.\(^9\)

**Detection Limits\(^{10}\)**

The detection limits of sensors D1-D4 were obtained according to the literature method. Take D4 as the example: Fluorescence changes during the titration of D4 (0.2 \(\mu\)M) with Zn\(^{2+}\) (0-0.6 \(\mu\)M) in DMF is shown in Figure S18a. The enhancement of fluorescence intensity is clearly resolved and has a good signal to noise ratio. The intensity data normalized between the minimum intensity (free D4) and the maximum intensity (0.6 \(\mu\)M Zn\(^{2+}\) added) are shown in Figure S18a (inset). A linear regression curve was fitted to the five intermediate values (50 nM-0.25 \(\mu\)M Zn\(^{2+}\)) as shown in Figure S18b. The detection limit of D4 to Zn\(^{2+}\) was calculated to be 46 nM.
