**Enhanced catalytic performance of assembled ceria necklace nanowires by Ni doping**

**Supplementary Information**

**Experimental Section**

**Chemicals** All chemicals were of analytical grade and were used as received without further purification. Deionized water was used throughout. Ce(NO$_3$)$_3$·6H$_2$O, NiCl$_2$, ethylene glycol, nitric acid supplied by Beijing Chemical Reagent Company.

**The synthesis of ceria necklace nanowires** In a typical synthesis, 1.0 mL of Ce(NO$_3$)$_3$ solution(0.5 mol/L), 0.2 mL nitric acid(7.5 mol/L) and 30 mL glycol were added with stirring to form a uniform solution. And then, the mixed solution was sealed in an autoclave and heated at 170°C for 15 hours. Then the products were separated from the solution by centrifugation (10000 r/min 20 minutes), washed with water and ethanol to remove ions and organic solvents possibly remnant in the products, dried at 80°C in air and annealed at 400°C for 4 hours.

**The synthesis of nickel doped ceria necklace nanowires** In a typical synthesis of Ni doped ceria necklace nanowires with Ni/Ce atom ratio of 3.8%, 1.0 mL Ce(NO$_3$)$_3$ solution(0.5 mol/L), 0.2 mL NiCl$_2$ solution(0.5 mol/L), 0.2 mL nitric acid(7.5 mol/L) and 30 mL glycol were added with stirring to form a uniform solution. And then, the mixed solution was sealed in an autoclave and heated at 170°C for 15 hours. Then the products were separated from the solution by centrifugation (10000 r/min 20 minutes), washed with water and ethanol, dried at 80°C in air and annealed at 400°C for 4 hours.

The synthesis of Ni doped ceria necklace nanowires with Ni/Ce ratio of 2.2% followed the same procedure except that 0.1 mL of nickel chloride solution was added.

**Characterization**

The catalytic activity was evaluated at atmospheric pressure in continuous flow fixed-bed quartz tubular reactor with 0.2 g catalyst and reactant gas mixture of 1.0% CO, 16% O$_2$, balanced with nitrogen at a rate of 100 ml/min. Gases went through the quartz tubular reactor were monitored by gas chromatography. The X-ray diffraction (XRD) patterns were obtained by using the a Bruker D8 Advance X-ray diffractometer with Cu-K$_\alpha$ radiation ($\lambda = 1.5418$ Å). The size and morphology of samples were obtained with a Hitachi H-7650 transmission electron microscope at 80 kV and a Tecnai G2 F20 S-Twin high-resolution transmission electron microscope at 200 kV. X-ray Photoemission Spectroscopy (XPS) experiments were carried in a PHI Quantera SXM$^\text{TM}$, calibrated internally by carbon deposit C (1s) binding energy (BE) at 284.6 eV. The nitrogen sorption isotherm was measured by volumetric method on an automatic adsorption instrument (Micromeritics, ASAP2010) at liquid nitrogen temperature (77 K). Specific surface area was calculated by the Brunauer-Emmett-Teller (BET) method from the data in a $P/P_0$ range between 0.05 and 0.2. H$_2$-TPR was performed using ChemBET Pulsar TPR/TPD by heating sample (50 mg) at 10°C/min to 700°C in H$_2$ flowing at 40 mL/min.
