**General information**

$^1$H and $^{13}$C NMR spectra were recorded on a Bruker AC-300 FT (300 MHz and 75 MHz, respectively) using tetramethylsilane as an internal reference, and chemical shifts ($\delta$) and coupling constants ($J$) were expressed in ppm and Hz, respectively. IR spectra were recorded on a Perkin-Elmer 2000 FTIR spectrometer. High resolution mass spectra (HRMS) were recorded on a LC-TOF spectrometer (Micromass). Electron spray ionization (ESI) high-resolution mass spectrometry data were acquired using a Thermo LTQ Orbitrap XL Instrument equipped with an ESI source and controlled by Xcalibur software. Melting points were uncorrected.

Benzhydrylamines and sulfonamides were prepared according to known procedures.$^1$ The preparation of $\beta$-keto acids was described below. The rest of chemicals were purchased from the Sinopharm Chemical Reagent Co., Meryer, Acros, and Alfa Aesar, and used as received. The solvents were dried over anhydrous magnesium sulfate prior to use.

**Preparation of $\beta$-keto acids$^2$**

To a $\beta$-keto ester (20 mmol) at room temperature was added aqueous sodium hydroxide (2 N, 20 mL). The mixture was stirred vigorously at room temperature for 12 h, and extracted with ether (2 x 20 mL). The aqueous layer was cooled with ice-water and acidified with aqueous HCl (1 N) until pH = 2, and extracted with ether (2 x 60 mL). The combined organic layers were dried over anhydrous sodium sulfate, and evaporated under reduced pressure at a temperature below 30 °C. The residue was pumped at 0.5 mmHg to remove extraneous water. The $\beta$-keto acids were stored in a freezer at -20 °C.

**General procedure for the decarboxylative alkylation of $\beta$-keto acids with sulfonamides (Tables 2 and 3)**

To a solution of sulfonamide 2 (0.20 mmol) in 1,2-dichloroethane (1.0 mL) at room temperature were added $\beta$-keto acid 1 (0.24 mmol) and FeCl$_3$ (3.2 mg, 10 mol%). The resulting mixture was stirred at 60 °C until no further transformation was detected by thin layer chromatography (TLC) analysis. The mixture was purified by column chromatography on silica gel, eluting with petroleum ether/ethyl acetate (20:1), to give product 3.

**Analytical data for the products shown in Tables 2 and 3**

**Reaction of sulfonamide (R)-2h with \(\beta\)-keto acid 1a**

This reaction was performed according to the general procedure for the decarboxylative alkylation of \(\beta\)-keto acids with sulfonamides. The ee of product 3p was determined to be 1% by chiral stationary phase HPLC analysis [Chiralpak AD column, isopropanol/n-hexane (2:98), flow rate = 0.50 mL/min, t(major) = 20.3 min, t(minor) = 27.3 min].

\(^1\)H NMR spectroscopic analysis of the reaction mixture

**Spectrum A:** To a solution of sulfonamide 2a (6.7 mg, 0.020 mmol,) in deuterated chloroform (0.50 mL) at room temperature was added \(\beta\)-keto acid 1a (3.9 mg, 0.024 mmol). The mixture was stirred vigorously at room temperature for 5 min, and injected into an NMR tube and subjected to \(^1\)H NMR (400 MHz) spectroscopic analysis.

**Spectrum B:** To a solution of sulfonamide 2a (67.4 mg, 0.20 mmol) in deuterated chloroform (5.0 mL) at room temperature were added sulfuric acid (2.0 mg, 0.020 mmol) and \(\beta\)-keto acid 1a (39.4 mg, 0.24 mmol). The mixture was stirred vigorously at room temperature for 2 h, and 0.50 mL of the mixture was injected into an NMR tube and subjected to \(^1\)H NMR (400 MHz) spectroscopic analysis.

**Spectrum C:** The above mixture was stirred for 4 h, and 0.50 mL of the mixture was injected into an NMR tube and subjected to \(^1\)H NMR (400 MHz) spectroscopic analysis.

Partial \(^1\)H NMR (400 MHz, CDCl\(_3\)) for \(\beta\)-keto acid 5: \(\delta 5.48 (d, J = 11.6 \text{ Hz}, 1H), 5.07 (d, J = 11.6 \text{ Hz}, 1H).\)

---

ESI-HRMS spectroscopic analysis of the reaction mixture

To a solution of sulfonamide 2a (67.4 mg, 0.20 mmol) in deuterated chloroform (5.0 mL) at room temperature were added sulfuric acid (2.0 mg, 0.020 mmol) and β-keto acid 1a (39.4 mg, 0.24 mmol). The mixture was stirred vigorously at room temperature for 1 h, and subjected to ESI-HRMS (positive model) spectroscopic analysis. Copied below is the ESI-HRMS spectrum we obtained.

HRMS (ESI) for β-keto acid 5: Calcd for C_{22}H_{18}O_{3}Na (M + Na)^+ 353.1148, found 353.1149.
