Experimental Section

_Measurements_

Cyclic voltammetry measurements of all samples were recorded on an ALS 600A Electrochemical Analyzer in 0.1 M Bu₄NClO₄/DMF using GC working electrode, Pt counter electrode, and saturated calomel reference electrode (SCE) in an undivided cell under nitrogen atmosphere. Controlled potential electrolysis was carried out with HOKUTO DENKO HABF-501A potentionstat. _1H, 13C, 11B_ and _19F_ NMR spectra were recorded on a JEOL EX-270 spectrometer ( _1H_: 270 MHz, _13C_: 67.8 MHz, _11B_: 86.6 MHz, _19F_: 254 MHz). The chemical shifts for _1H, 13C, 19F_ and _11B_ NMR spectra were given in δ (ppm) from internal TMS (0.0 ppm), CDCl₃ (77.0 ppm),
monofluorobenzene (-36.5 ppm), and external boron trifluoride-diethyl ether complex (0.0 ppm) standards, respectively. High resolution mass spectrum (HRMS) was recorded on JEOL The MStation JMS-700. Molecular orbital were obtained using Gaussian 03W calculated by DFT B3LYP/6-31G+(2d,p)//B3LYP/6-31G(d).

**Materials**

All reagents and solvent were purchased commercial sources and used without further purification.

**Preparation of carborane derivative 1b**

1-(N-Trimethyl-4-ammoniumphenyl)-2-phenyl-o-carborane bis(trifluoromethanesulfonyl)-amide (1b) (Scheme S1): To a stirred solution of 1-(4-aminophenyl)-2-phenyl-o-carborane¹ (0.30 g, 1.0 mmol) and potassium carbonate (0.35 g, 2.5 mmol) in CH₃CN (30 ml) was added an excess amount of methyl iodide (4.0 ml) under Ar atmosphere and the reaction mixture was stirred for 6 h at room temperature. Then the organic solvent was removed under reduced pressure, and the residue was dissolved in CHCl₃. After filtration, the filtrate was washed with water and the organic phase was condensed. The crude oil was purified by washing with hexane to give 1-(N-trimethyl-4-ammoniumphenyl)-2-phenyl-o-carborane iodide as a yellow solid (0.39 g, 0.82 mmol, yield: 82%). This compound (0.30 g, 0.62 mmol) was then dissolved in CH₂Cl₂ (10 ml) and
mixed with water (10 ml) containing lithium bis(trifluoromethanesulfonyl)amide (0.54 g, 1.87 mmol) and the reaction mixture was stirred vigorously for 2 h at room temperature. The organic phase was separated and washed with water. The removal of the solvent under reduced pressure afforded the titled compound in 61% yield (0.24 g, 0.39 mmol) as a yellow oil. $^1$H NMR (270 MHz, CDCl$_3$) δ 7.66 (d, $J$ = 9.4 Hz, 2H), 7.55 (d, $J$ = 9.4 Hz, 2H), 7.44 (d, $J$ = 7.8 Hz, 2H), 7.24 (m, 3H), 3.54 (s, 9H), 3.7-1.3 (br, 10H); $^{13}$C NMR (67.8 MHz, CDCl$_3$) δ 147.2, 133.9, 133.1, 130.8, 130.5, 129.8, 128.7, 119.7 (q, $J$ = 320 Hz) 119.5, 85.4, 81.7, 57.4; $^{11}$B NMR (86.6 MHz, CDCl$_3$) δ -2.26, -10.8; $^{19}$F NMR(254 MHz, CDCl$_3$) δ -2.21; HRMS Calcd for C$_{17}$H$_{28}$B$_{10}$N$: 356.3152$, found: 356.3159. Calcd for C$_2$F$_6$NO$_4$S$_2$: 279.9173, found: 279.9174.

**A typical procedure for macroelectrolysis**

A divided cell equipped with electrodes and a salt bridge was sealed by rubber closure under a nitrogen atmosphere. Bu$_4$NClO$_4$ (510 mg, 1.5mmol), (PhBrCH)$_2$ (51.0 mg, 0.15 mmol) and $\alpha$-Ph$_2$C$_2$B$_{10}$H$_{10}$ were dissolved in DMF (15 ml) and the mixture was stirred for 10 min with N$_2$ bubbling. Then, controlled potential electrolysis was carried out at $-1.30$ V under N$_2$. After the
theoretical electricity was passed, water was added to quench the reaction. The product was extracted with hexane and the organic phase was dried over anhydrous MgSO₄. Then, the solvent was evaporated under reduced pressure to give a product. ¹H-NMR yields were estimated by comparing the intensities of peaks with that of CH₃NO₂ as an internal standard material.
