Contents:
ESI 1. Materials and Methods
ESI 2. Synthesis procedures of 8-formyl-7-hydroxy-4-methylcoumarin (2), host molecular
ESI 3. Fluorescence responses of host molecular to various metals in three different system
ESI 4. Competition experiment of host molecular towards Mg$^{2+}$ in the multicomponent system
ESI 5. The promoting effects of Na$^+$ and L-proline
ESI 6. The promoting effect of L-proline, D-proline and racemic praline
ESI 7. Calculation of the detection limit
ESI 8. $^1$H NMR and $^{13}$C NMR Spectra
ESI 9. Mass spectrum of host molecular
ESI 10. References
ESI 1. Instrumentation and Materials

All solvents and reagents were commercially available and analytical-reagent-grade. THF was purified by distillation from sodium in the presence of benzophenone and Et$_3$N was newly distilled before using. NMR spectra were collected on a 300-Bruker spectrometer 300 MHz for $^1$H NMR and 75 MHz for $^{13}$C NMR and reported as parts per million (ppm) from the internal standard TMS. MS was determined on a Micromass GCT. FT-IR spectra were taken on a Nexus 870 FT-IR spectrometer. Ultraviolet-visible (UV-vis) spectra were obtained using a Shimadzu UV-Vis-NIR spectrophotometer.

Each metal ion titration experiment was started with a 3.0 mL ligand with a known concentration (1.0×10$^{-5}$ mol/L corresponding to host molecular in CH$_3$CN solution). Mg(NO$_3$)$_2$ salt and other various metal salts (nitrate, 1.0 ×10$^{-3}$ mol/L, H$_2$O) were used for the titration. Ligand-metal complexes were produced by adding aliquots of a solution of the selected metal salt to a CH$_3$CN solution of the ligand.

ESI 2. Synthesis procedures of 8-formyl-7-hydroxy-4-methylcoumarin (2), host molecular

![Scheme 1 Synthesis procedures of Host molecular](image)

**Synthesis of 8-formyl-7-hydroxy-4-methylcoumarin (2) $^{[1]}$**

8-Formyl-7-hydroxy-4-methylcoumarin was prepared according to the literature. $^{[1]}$ 7-Hydroxy-4-methylcoumarin (10g, 56.8mol) and hexamine (19.9g, 142mmol) in glacial acetic acid (90 mL) were heated for 6 h. Then 20% HCl (130 mL) was added in and the mixture was further heated for 40 min, after which the mixture was cooled and extracted with ether twice (50mL× 2). The combined organic layer was concentrated under reduced pressure to afford 8-formyl-7-hydroxy-4-methylcoumarin as light yellow powder. The crude product was recrystallized from ethanol (yield, 15%). m.p. 140-142°C. $^1$H NMR (300 MHz, CDCl$_3$): δ12.24 (s, 1H), 10.64 (s, 1H), 7.76-7.73 (d, 1H), 6.94-6.91 (d, 1H), 6.23 (s, 1H), 2.45 (s, 3H). $^{13}$C NMR (75 MHz, CDCl$_3$): δ191.7, 164.0, 160.2, 155.6, 154.0, 133.7, 114.0, 112.2, 111.5, 109.3, 18.8. FT-IR
(KBr, cm$^{-1}$): 3050, 1720, 1610.

**Synthesis of 7-hydroxy-8-((3-hydroxy-phenylimino)methyl)-4-methyl-coumarin** [2]

\[

&\text{OH} \\
&\text{N} \\
&\text{HO} \\
&\text{O} \\
&\text{O}
\end{align*}
\]

8-formyl-7-hydroxy-4-methylcoumarin (102mg, 0.5mmol) was dissolved in anhydrous THF (8mL) with stirring, then o-aminophenol (65.4mg, 0.6mmol) in ethanol was added into the above solution. The obtained solution was stirred at 25-30°C for 5 hour. Solid precipitated and collected by filtering. The obtained solid was washed with ethanol for 5 times. Then the crude product was recrystallized from EtOH (86.0% yield). m.p. 182-184 °C. $^1$H NMR (300 MHz, CDCl$_3$): δ14.95 (s, 1H), 9.75 (s, 1H), 9.17 (s, 1H), 7.80-7.76 (d, 1H), 7.29-7.26 (d, 1H), 7.00-6.87 (m, 3H), 6.80-6.76 (d, 1H), 6.23 (s, 1H) 2.40 (s, 1H). MS (EI, m/z): 295.1 (M$^+$$^*$). $^{13}$CNR (75 MHz, CDCl$_3$): δ166.28, 159.51, 158.94, 156.57, 154.50, 154.32, 147.61, 130.93, 130.85, 115.39, 114.77, 112.86, 111.16, 110.74, 108.00, 106.47, 18.78.
