Supporting Information.

General experimental. All manipulations on air sensitive compounds were performed under nitrogen atmosphere using standard Schlenk techniques or in a drybox. All solvents were dried by passing them through activated Al₂O₃ (SolvtekH purification system). All other reagents were used without further purification. Flash column chromatography was performed with Silicycle silica gel (40 – 63 µm). IR spectra were recorded on a Perkin-Elmer Spectrum One spectrophotometer. ¹H NMR and ¹³C NMR spectra were recorded on either a Bruker Avance300 (¹H, 300 MHz) or Bruker AMX-400 (¹H, 400 MHz; ¹³C, 100 MHz) spectrometer. High-resolution mass spectra, performed by the Université de Genève Laboratoire de Science Mass Spectrometrie, were obtained on a quadrupole-time of flight Q STAR XL AppliedBiosystems/MDS Sciex mass spectrometer. Optical rotations were obtained on a Perkin-Elmer 241 polarimeter equipped with a quartz cell (l = 10 cm) and a Na high-pressure lamp (λ = 589 nm). HPLC was performed on an Agilent 1100 series chromatograph. ¹H NMR chemical shifts are reported relative to residual protiated solvent. ¹³C NMR chemical shifts are reported relative to the deuterated solvent. Values of the coupling constants are obtained directly from the spectrum. Although generally measured to ±0.1 Hz, J values are self-consistent to only ±0.5 Hz. Data for the ¹H-¹H COSY is presented such that correlations are listed only once. Compounds prepared by published procedures: 2-bromo-N-methylaniline,¹ 3-bromo-N-methylpyridin-2-amine,² N-(2-bromophenyl)-N-methyl-2-oxo-2-phenylacetamide,³ N-(2-bromophenyl)-2-(4-methoxyphenyl)-N-methyl-2-oxoacetamide,⁴ N-(2-bromophenyl)-2-(4-trifluoromethylphenyl)-N-methyl-2-oxoacetamide,³ N-(2-bromophenyl)-N-methyl-2-(naphthalene-1-yl)-2-oxoacetamide,³ N-(2-bromophenyl)-2-(2-methoxyphenyl)-N-methyl-2-oxoacetamide,³ [HPtBu₃]BF₄,⁴ and Pd(dbʌ)₂.⁵ Ketocarboxylic acids were prepared via addition of the appropriate Grignard reagent to diethyl oxalate,⁶ followed by saponification.

To this, NaBH₄ (0.051 g, 1.33 mmol) was added and the reaction was allowed to warm slowly to room temperature overnight. The reaction was then diluted with Et₂O and acidified with 1N HCl to a pH of 6. The layers were separated and the aqueous layer extracted with Et₂O. The organic fractions were combined and washed with water, then brine, and dried over MgSO₄. The solvent was removed in vacuo and the product purified by silica gel chromatography with 20% EtOAc/pentane. The fractions were concentrated and residual solvent removed under vacuum to yield 0.35 g (87%) of the desired alcohol as a white solid.

Spectroscopically, the product is a 1.2:1 mixture of rotamers. **N-(2-bromophenyl)-2hydroxyl-N-methyl-2-phenylpropanamide (3l).** In a Schlenk flask, ketoamide (580 mg, 1.82 mmol) was dissolved in THF (10 mL) under a nitrogen atmosphere and cooled to $-78$ °C. To this, MeMgBr (1.2 mL, 3.6 mmol, 3M in diethyl ether) was added and allowed to warm to room temperature overnight. The reaction was quenched with saturated NH$_4$Cl solution and the layers separated. The aqueous layer was extracted with diethyl ether, and the combined organic fractions were washed with brine and dried over Na$_2$SO$_4$. The solvent was removed and the residue purified by silica gel chromatography using 20% EtOAc/pentane to yield 256 mg (42%) of product as a white solid. The NMR spectra are extremely complicated.
