3. General procedures
4. Preparation of secondary alcohols (compounds 8, 10a-f)
5. $^1$H NMR, $^{13}$C NMR and $^{11}$B NMR spectra
1. General information

All required fine chemicals were used directly without purification unless mentioned. Compounds lacking experimental details were prepared according to the literature as cited and are in agreement with published spectra. All air- and water-sensitive reactions were carried out in flame-dried glassware under argon atmosphere using standard Schlenk manifold technique. $^1$H- and $^{13}$C- Nuclear Magnetic Resonance (NMR) spectra were acquired at various field strengths as indicated, and were referenced to CHCl$_3$ (7.27 and 77.0 ppm for $^1$H and $^{13}$C respectively) or TMS (0.00 ppm for $^1$H and $^{13}$C). $^1$H NMR coupling constants are reported in Hertz and refer to apparent multiplicities and not true coupling constants. Data are reported as follows: chemical shift, multiplicity (s = singlet, br $s =$ broad singlet, d = doublet, t = triplet, q = quartet, qi = quintet, sx = sextet, sp = septet, m = multiplet, dd = doublet of doublet, etc.) and integration. $^{11}$B-NMR spectra were recorded with complete proton decoupling using BF$_3$·Et$_2$O (0.0 ppm) as an external standard. High resolution mass spectra were recorded using Electronic Ionization (EI), Electron Spray Ionization (ESI) or Chemical Ionization (CI). For CI, methane or NH$_4$OAc/MeOH was used. All IR data was obtained on a Perkin-Elmer Spectrum One FT-IR spectrometer. Optical rotations were obtained on a Perkin-Elmer 241MC polarimeter. Analytical TLC: aluminium backed plates pre-coated (0.25 mm) with Merck Silica Gel 60 F$_{254}$. Compounds were visualized by exposure to UV-light or by dipping the plates in either a 5% solution of (NH$_4$)$_2$Mo$_7$O$_{24}$•4 H$_2$O or [MoO$_3$]$_{12}$[PO$_4$H$_3$] in EtOH followed by heating. Flash column chromatography was performed using Merck Silica Gel 60 (40-63 μm). All mixed solvent eluents are reported as v/v solutions. Melting points were determined with a Boetius hot stage apparatus and were not corrected. Chiral HPLC was performed using a Diacel Chiralpak IB column (4.6 × 250 mm × 5 μm) fitted with a guards (4 × 10 mm), and monitored by DAD (Diode Array Detector). Solvents were purified by standard methods.\(^1\) TMEDA was distilled over CaH$_2$. (−)-Sparteine was obtained from the commercially available sulfate pentahydrate salt (99%, Acros) and

isolated according to the literature procedure. The (−)-sparteine free base readily absorbs atmospheric carbon dioxide (CO₂) and should be stored under argon at −20 °C in a schlenk tube. s-BuLi was purchased from Acros. The molarity of organolithium solutions was determined by titration using salicylaldehyde phenylhydrazone as indicator.²

2. **Preparation of starting materials**

3-Phenylpropyl 2,4,6-triisopropylbenzoate (7a)

NaH (60% in mineral oil, 1.44 g, 35.9 mmol) was introduced into a 100 mL sealable reaction vessel and THF (50 mL) was added. The resulting mixture was cooled to 0 °C and 3-phenylpropan-1-ol (6.10 mL, 45.0 mmol) was added dropwise. The heterogeneous mixture was stirred for 1 h at 0 °C and 2 h at room temperature, and 2,4,6-triisopropylbenzoyl chloride (8.00 g, 30.0 mmol) was added portion-wise over 5 min. When the initial exotherm ended, the reaction flask was sealed, placed into an oil bath equilibrated at 90 °C and stirred for 18 h. The reaction mixture was allowed to warm to room temperature and quenched with water. EtOAc was added, the layers were separated and the aqueous phase was extracted with EtOAc. The combined organic layers were washed with 1 N HCl, 1 N NaOH, water and brine, dried (MgSO₄), concentrated and purified by column chromatography (SiO₂, 98:2 to 97:3 petroleum ether/EtOAc) to obtain the desired benzoate 7a (8.77 g, 80%) as a light yellow oil.

$^1$H NMR (400 MHz, CDCl₃) δ ppm 1.26 (6 H, d, J = 7.0 Hz), 1.27 (12 H, d, J = 7.0 Hz), 2.09-2.03 (2 H, m), 2.77-2.73 (2 H, m), 2.95-2.83 (3 H, m), 4.33 (2 H, t, J = 6.5 Hz), 7.02 (2 H, s), 7.25-7.18 (3 H, m), 7.34-7.28 (2 H, m).

$^{13}$C NMR (100 MHz, CDCl₃) δ ppm 23.9 (1 CH₃), 24.2 (2 CH₃), 30.4 (1 CH₂), 31.5 (2 CH), 32.3 (1 CH₂), 34.4 (1 CH), 64.3 (1 CH₂), 120.8 (1 CH), 126.1 (1 CH), 128.4 (1 CH), 128.5 (1 CH), 130.6 (1 C), 141.1 (1 C), 144.7 (2 C), 150.1 (1 C), 170.9 (1 C).

IR (film): v (cm⁻¹) 2960, 2928, 1726, 1606, 1461, 1283, 1251, 1137, 1103, 1075, 877, 699.

HRMS (EI) calcd. for C₂₅H₃₄O₂ [M]$^+$ 366.2559, found 366.2552.

Ethyl 2,4,6-triisopropylbenzoate (7b)

NaH (60% in mineral oil, 655 mg, 16.4 mmol) was introduced into a 100 mL sealable reaction vessel and THF (14 mL) was added. The resulting mixture was cooled to 0 °C and ethanol
(1.2 mL, 20.5 mmol) was added dropwise. The heterogeneous mixture was stirred for 1 h at room temperature, and 2,4,6-triisopropylbenzoyl chloride (3.64 g, 13.6 mmol) was added portion-wise over 5 min. When the initial exotherm ended, the reaction flask was sealed, placed into an oil bath equilibrated at 90 °C and stirred for 18 h. The reaction mixture was allowed to warm to room temperature and quenched with water. EtOAc was added, the layers were separated and the aqueous phase was extracted with EtOAc. The combined organic layers were dried (MgSO₄), concentrated and purified by column chromatography (SiO₂, 98:2 to 97:3 petroleum ether/EtOAc) to obtain the desired benzoate 7b (2.84 g, 76%) as a light yellow oil.

Data recorded for this compound were in accordance with literature values.¹

¹H NMR (400 MHz, CDCl₃) δ ppm 1.26 (6 H, d, J=7.0 Hz), 1.26 (12 H, d, J=6.9 Hz), 1.38 (3 H, t, J=7.2 Hz), 2.80-2.96 (3 H, m), 4.39 (2 H, q, J=7.3 Hz), 7.02 (2 H, s).

¹³C NMR (100 MHz, CDCl₃) δ ppm 14.2 (1 CH₃), 23.9 (1 CH₃), 24.1 (1 CH₃), 31.4 (1 CH), 34.4 (1 CH), 60.7 (1 CH₂), 120.8 (1 CH), 130.6 (1 C), 144.7 (1 C), 150.0 (1 C), 170.8 (1 C).

**Isobutyl 2,4,6-triisopropylbenzoate (7c)**

NaH (60% in mineral oil, 1.09 g, 27.0 mmol) was introduced into a 100 mL sealable reaction vessel and THF (14 mL) was added. The resulting mixture was cooled to 0 °C and isobutanol (2.5 mL, 27.0 mmol) was added dropwise. The heterogeneous mixture was stirred for 1 h at room temperature, and 2,4,6-triisopropylbenzoyl chloride (3.64 g, 13.6 mmol) was added portion-wise over 5 min. When the initial exotherm ended, the reaction flask was sealed, placed into an oil bath equilibrated at 90 °C and stirred for 18 h. The reaction mixture was allowed to warm to room temperature and quenched with water. EtOAc was added, the layers were separated and the aqueous phase was extracted with EtOAc. The combined organic layers were dried (MgSO₄), concentrated and purified by column chromatography (SiO₂, 98:2 to 97:3 petroleum ether/EtOAc) to obtain the desired benzoate 7c (3.66 g, 88%) as a light yellow oil.

$^1$H NMR (400 MHz, CDCl$_3$) δ ppm 1.00 (6 H, d, $J$=6.6 Hz), 1.26 (18 H, d, $J$=6.8 Hz), 2.04 (1 H, sp, $J$=6.6 Hz), 2.87 (2 H, sp, $J$=6.8 Hz), 2.92 (1 H, sp, $J$=6.8 Hz), 4.10 (2 H, d, $J$=6.6 Hz), 7.02 (2 H, s).

$^{13}$C NMR (100 MHz, CDCl$_3$) δ ppm 19.3 (2 CH$_3$), 23.9 (2 CH$_3$), 24.2 (4 CH$_3$), 27.7 (1 CH), 31.5 (1 CH), 34.4 (1 CH), 71.3 (1 CH), 120.8 (2 CH), 130.8 (1 C), 144.7 (1 C), 150.0 (1 C), 171.1 (1 C).

IR (film): $\nu$ (cm$^{-1}$) 2960, 2872, 1724, 1607, 1462, 1283, 1247, 1136, 1103, 1074, 980, 876, 769.

HRMS (Cl) calcd. for C$_{20}$H$_{32}$O$_2$ [M]$^+$ 305.2481, found 305.2469.

**tert-Butyl 3-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)propanoate (9e)**

THF (1 mL) was added to a flask under nitrogen containing copper chloride (4 mg, 0.04 mmol), sodium tert-butoxide (12 mg, 0.12 mmol) and DPEPhos (22 mg, 0.04 mmol) and stirred at room temperature for 30 minutes. Bis(pinacolato)diboron (364 mg, 1.44 mmol) dissolved in THF (1 mL) was added dropwise via syringe and the flask was washed with further THF (1 mL). This mixture was stirred for 30 minutes at room temperature before tert-butyl acrylate (0.20 mL, 1.37 mmol) and methanol (0.1 mL) were added and the mixture stirred at room temperature for a further 3 h. The resultant slurry was filtered through Celite®, washed with ethyl acetate and concentrated in vacuo. The crude oil was purified by flash column chromatography (SiO$_2$, 98:2 Petroleum ether/EtOAc) to give boronic ester 9e (1.15 g, 84%) as a colourless liquid.

Data recorded for this compound were in accordance with literature values.$^5$

$^1$H NMR (400 MHz, CDCl$_3$) δ ppm 0.95 (2 H, t, $J$=7.4 Hz), 1.23 (12 H, s), 1.35 (9 H, s), 2.34 (8 H, t, $J$=7.4 Hz).

$^{13}$C NMR (100 MHz, CDCl$_3$) δ ppm 24.8 (4 CH$_3$), 28.1 (3 CH$_3$), 29.9 (1 CH$_2$), 79.7 (2 C), 83.1 (1 C), 174.0 (1 C).

$^{11}$B NMR (129 MHz, CDCl$_3$) δ ppm 32.9.

---

3-(4,4,5,5-Tetramethyl-1,3,2-dioxaborolan-2-yl)propanenitrile (9f)

THF (22 mL) was added to a flask under nitrogen containing copper chloride (65 mg, 0.66 mmol), sodium tert-butoxide (190 mg, 1.98 mmol) and DPEPhos (356 mg, 0.66 mmol) and stirred at room temperature for 30 minutes. Bis(pinacolato)diboron (5.87 g, 23.1 mmol) dissolved in THF (22 mL) was added dropwise via syringe and the flask was washed with further THF (10 mL). This mixture was stirred for 30 minutes at room temperature before acrylonitrile (1.45 mL, 22 mmol) and methanol (2.2 mL) were added and the mixture stirred at room temperature for 16 h. The resultant slurry was filtered through Celite®, washed with ethyl acetate and concentrated in vacuo. The crude oil was purified by flash column chromatography (SiO$_2$, 95:5 CH$_2$Cl$_2$/EtOAc) to give boronic ester 9f (3.64 g, 91%) as a colourless liquid.

Data recorded for this compound were in accordance with literature values.$^5$

$^1$H NMR (400 MHz, CDCl$_3$) δ ppm 1.17 (2 H, t, $J$=8.0 Hz), 1.25 (12 H, s), 2.40 (2 H, t, $J$=7.8 Hz).

$^{13}$C NMR (100 MHz, CDCl$_3$) δ ppm 11.9 (1 CH), 24.7 (4 CH$_3$), 83.9 (2 C), 120.0 (1 C).

$^{11}$B NMR (129 MHz, CDCl$_3$) δ ppm 32.9.
3. **General Procedures**

**GP1: Lithiation-Borylation of primary 2,4,6-triisopropylbenzoates.**
To a solution of primary 2,4,6-triisopropylbenzoate (0.8 mmol) and (−)-sparteine (0.96 mmol) in Et₂O (4 mL) at −78 °C was added s-BuLi (1.3 M in 92:8 cyclohexane/hexane, 0.88 mmol) dropwise. The resulting brown mixture was stirred for 4 h at −78 °C before boronic ester (0.96 mmol) was added (neat for liquid boronic ester or as a 1 M Et₂O solution for solid boronic ester). The reaction mixture was further stirred at −78 °C for 1 h, allowed to warm to room temperature and refluxed until analysis of the reaction mixture by ¹¹B NMR showed no more boron-ate complex peak (typically ~5-8 ppm). The reaction mixture was cooled to 0 °C and a solution of NaOH (2 M)/H₂O₂ (30%) (2:1 v/v, 4.0 mL) was added dropwise and allowed to stir at room temperature for 2 h. After this time the layers were separated and the aqueous phase was extracted with Et₂O (2 × 10 mL). The combined organic layers were dried (MgSO₄), concentrated and purified by column chromatography (SiO₂) to obtain the pure secondary alcohols. Racemic alcohols were obtained by substituting (−)-sparteine by TMEDA.

**GP2: Lithiation-Borylation of primary N,N-diisopropylcarbamates.**
To a solution of primary carbamate (0.8 mmol) and (−)-sparteine (0.96 mmol) in Et₂O (4 mL) at −78 °C was added s-BuLi (1.3 M in 92:8 cyclohexane/hexane, 0.88 mmol) dropwise. The resulting yellow mixture was stirred for 5 h at −78 °C before boronic ester (0.96 mmol) was added (neat for liquid boronic ester or as a 1 M Et₂O solution for solid boronic ester). The reaction mixture was further stirred at −78 °C for 1 h, before being allowed to warm to room temperature. The reaction mixture was refluxed for >16 h until analysis of the reaction mixture by ¹¹B NMR showed no more boron-ate complex peak (typically at ~5-8 ppm). The reaction mixture was cooled to 0 °C and a solution of NaOH (2 M)/H₂O₂ (30%) (2:1 v/v, 4.0 mL) was added dropwise and allowed to stir at room temperature for 2 h. After this time the layers were separated and the aqueous phase was extracted with Et₂O (2 × 10 mL). The combined organic layers were dried (MgSO₄),

---

concentrated and purified by column chromatography (SiO₂) to obtain the pure secondary alcohols.
Racemic alcohols were obtained by substituting (−)-sparteine by TMEDA.

**GP3: Lithiation-Borylation of primary N₅N-diisopropylcarbamates using magnesium bromide etherate.**

To a solution of primary carbamate (0.8 mmol) and (−)-sparteine (0.96 mmol) in Et₂O (4 mL) at −78 °C was added s-BuLi (1.3 M in 92:8 cyclohexane/hexane, 0.88 mmol) dropwise. The resulting yellow mixture was stirred for 5 h at −78 °C before boronic ester (0.96 mmol) was added (neat for liquid boronic ester or as a 1 M Et₂O solution for solid boronic ester). The reaction mixture was further stirred at −78 °C for 1 h, before being allowed to warm to room temperature. At this point, both layers of a biphasic mixture of MgBr₂·OEt₂ [freshly made from stirring Mg turnings (2.4 mmol) and 1,2-dibromoethane (1.6 mmol) in Et₂O (4 mL) at room temperatures for 2 h] was added via syringe. The reaction mixture was refluxed for >16 h until analysis of the reaction mixture by ¹¹B NMR showed no more boron-ate complex peak (typically at ~5-8 ppm). The reaction mixture was cooled to 0 °C and a solution of NaOH (2 M)/H₂O₂ (30%) (2:1 v/v, 4.0 mL) was added dropwise and allowed to stir at room temperature for 2 h. After this time the layers were separated and the aqueous phase was extracted with Et₂O (2 × 10 mL). The combined organic layers were dried (MgSO₄), concentrated and purified by column chromatography (SiO₂) to obtain the pure secondary alcohols.
Racemic alcohols were obtained by substituting (−)-sparteine by TMEDA.
4. Preparation of secondary alcohols

(S)-3-Phenyl-1-(tributylstanny)propyl 2,4,6-triisopropylbenzoate (8)

\[
\begin{align*}

\text{O} & \quad \text{Bu}_3\text{Sn} \\
\end{align*}
\]

s-BuLi (1.43 M in 92:8 cyclohexane/hexane, 0.4 mL, 0.57 mmol) was added dropwise to a solution of 3-phenylpropyl 2,4,6-triisopropylbenzoate (7a) (200 mg, 0.55 mmol) and (−)-sparteine (0.14 mL, 0.60 mmol) in Et₂O at −78 °C. The brown solution was stirred at that temperature for 4 h before tributyltin chloride (178 µL, 0.66 mmol) was added dropwise. The reaction mixture was stirred for 30 min at −78 °C before being warmed to room temperature and quenched with water. Et₂O was added, the layers were separated and the aqueous phase was extracted with Et₂O. The combined organic layers were dried (MgSO₄), concentrated and purified by column chromatography (SiO₂, 17:3 pentane/toluene) to obtain the desired α-stannyl benzoate (S)-8 (1.13 g, 95%) as a colourless oil.

(S)-1-Phenylpentan-3-ol (10c)

According to GP1, 3-phenylpropyl 2,4,6-triisopropylbenzoate (7a) (293 mg, 0.80 mmol) was treated with s-BuLi (1.3 M in 92:8 cyclohexane/hexane, 0.68 mL, 0.88 mmol), (−)-sparteine (0.22 mL, 0.96 mmol) and ethylboronic acid pinacol ester (150 mg, 0.96 mmol) in Et₂O (4 mL) and refluxed for 2 h, followed by oxidation with a solution of NaOH (2 M)/H₂O₂ (30%) (2:1 v/v, 4.0 mL) to give, after purification by column chromatography (SiO₂, 20:80 EtOAc/petroleum ether), the desired alcohol 10c (110 mg, 84%) as a white solid.

According to GP2, 3-phenylpropyl diisopropylcarbamate (1a) (210 mg, 0.80 mmol) was treated with s-BuLi (1.3 M in 92:8 cyclohexane/hexane, 0.68 mL, 0.88 mmol), (−)-sparteine (0.22 mL, 0.96 mmol) and ethylboronic acid pinacol ester (150 mg, 0.96 mmol) in Et₂O (4 mL) and refluxed for 16 h, followed by oxidation with a solution of NaOH (2 M)/H₂O₂ (30%) (2:1 v/v, 4.0 mL) to give, after purification by column chromatography (SiO₂, 20:80 EtOAc/petroleum ether), the desired alcohol 10c (96 mg, 73%) as a white solid.

According to GP3, 3-phenylpropyl diisopropylcarbamate (1a) (210 mg, 0.80 mmol) was treated with s-BuLi (1.3 M in 92:8 cyclohexane/hexane, 0.68 mL, 0.88 mmol), (−)-sparteine (0.22 mL, 0.96 mmol) and ethylboronic acid pinacol ester (150 mg, 0.96 mmol) in Et₂O (4 mL), followed by MgBr₂·OEt₂ (4 mL), refluxed for 16 h, and subsequent oxidation with a solution of NaOH (2 M)/H₂O₂ (30%) (2:1 v/v, 4.0 mL) to give, after purification by column chromatography (SiO₂, 20:80 EtOAc/petroleum ether), the desired alcohol 10c (92 mg, 70%) as a white solid.

Data recorded for this compound were in accordance with literature values.⁶

Mp 36 – 39 °C. Lit. 34 – 36 °C.

HPLC separation conditions: Chiralpak IB column with guard, 3.0% iPrOH in hexane, flow rate: 0.7 mL/min, 20 °C; \(t_R\) 14.8 min for (S)-enantiomer (minor) and \(t_R\) 18.7 min for (R)-enantiomer (major).

e.r. = 96:4.

(R)-4-Hydroxy-6-phenylhexanenitrile (10f)

To a solution of primary 2,4,6-triisopropylbenzoate (263 mg, 0.80 mmol) and (-)-sparteine (0.22 mL, 0.96 mmol) in Et\(_2\)O (4 mL) at −78 °C was added \(s\)-BuLi (1.3 M in 92:8 cyclohexane/hexane, 0.88 mmol) dropwise. The resulting brown mixture was stirred for
4 h at −78 °C propionitrile boronic acid pinacol ester (174 mg, 0.96 mmol) was added. The reaction mixture was further stirred at −78 °C for 1 h, allowed to warm to room temperature and refluxed for 16 h. The reaction mixture was cooled to room temperature and water (4 mL) was added. The layers were separated and the aqueous phase was extracted with Et₂O (2 × 10 mL). The combined organic layers were dried (MgSO₄), concentrated and purified by column chromatography (SiO₂, 10:90 EtOAc/petroleum ether) to obtain the pure secondary boronic ester (129 mg, 54%, 69% brsm) as a colourless oil. Et₂O (4 mL) was added followed by sodium perborate tetrahydrate (80 mg, 0.52 mmol) and water (4 mL) and allowed to stir at room temperature for 24 h. After this time the layers were separated and the aqueous phase was extracted with Et₂O (2 × 10 mL). The combined organic layers were dried (MgSO₄), concentrated and purified by column chromatography (SiO₂, 30:70 EtOAc/petroleum ether) to obtain the pure alcohol 10f (69 mg, 84%) as a colourless oil (46% over two steps, 58% brsm).

Although the data for this compound does not match the reported literature data⁹ (only ¹H NMR and IR provided), our full characterisation confirms the structure of nitrile 10f.
