General Methods. NMR spectra were acquired on a Bruker 300 spectrometer, running at 300 and 75 MHz for \( ^1 \)H and \( ^{13} \)C, respectively. Chemical shifts (\( \delta \)) are reported in ppm relative to residual solvent signals (CHCl\(_3\), 7.26 ppm for \( ^1 \)H NMR, CDCl\(_3\), 77.0 ppm for \( ^{13} \)C NMR). The following abbreviations are used to indicate the multiplicity in \( ^1 \)H NMR spectra: s, singlet; d, doublet; t, triplet; m, multiplet; bs, broad singlet; a, apparent. \( ^{13} \)C NMR spectra were acquired on a broad band decoupled mode. Infrared (IR) spectra were measured in a Perkin-Elmer 1600 apparatus and only characteristic bands are given. Mass spectra (HMRS/MS) were recorded on a Mass Spectrometer provided with a Time of Flight (TOF) (GCT de Micromass) coupled to a Gas Chromatograph (Agilent 6890N). Analytical thin layer chromatography (TLC) was performed using pre-coated aluminum-backed plates (Merck Kieselgel 60 F254) and visualized by ultraviolet irradiation or Phosphomolybdic Acid dip.\(^2\) Melting points (M.p.) were measured in a Büchi B-540 apparatus. Optical rotations were measured on a Perkin-Elmer 241 polarimeter and Jasco P-2000. The enantiomeric excess (e.e.) of the products were determined by chiral stationary phase HPLC in a Waters 2695 using photodiode array detector Waters 2998 and using Daicel Chiralpak (AS-H, AD-H) and Daicel Chiralcel (OD) columns.

Materials. Analytical grade solvents and commercially available reagents were used without further purification. For flash chromatography silica gel (Silica gel 60, 230-400 mesh, Merck) was used.

Experimental Procedures and Characterizations.

**General Procedure for the Preparation of Ylides 1a-b.** The corresponding nitrogen heterocycle (2.0 mmol) was added into a solution of tetracyanoethylene oxide (TCENO)\(^3\) (1.0 mmol) in THF at 0 °C. The reaction was stirred at 4 °C during the necessary time and the formed solid was recrystallized or filtrated under vacuum.

**Isoquinolinium-2-dicyanomethanide (1a).** Following the general procedure \(1a\) (6.26 g, 32.4 mmol) was synthesized by adding isoquinoline (2.77 g, 21.4 mmol) to a solution of TCNEO (6.00 g, 41.6 mmol) in THF (50 mL) at 0 °C. The reaction was stirred at 4 °C during 20 h. Then, the solvent was evaporated and the formed solid was recrystallized in EtOH. Yield: 78%. M.p.: 253-255 °C (Lit.\(^4\): 258-259 °C).

**Phthalazinium-2-dicyanomethanide (1b).** Following the general procedure \(1b\) (0.89 g, 4.16 mmol) was synthesized by adding phthalazine (1.89 g, 14.58 mmol) to a solution of TCNEO (0.70 g, 4.86 mmol) in THF (50 mL) at 0 °C. The reaction was stirred at this temperature during 2 h. Then, the formed solid was filtrated and washed with cold THF (3 × 25 mL). Yield: 95%. M.p.: 255-256 °C (Lit.\(^5\): 264-265 °C).

**General Procedure for the Synthesis of Aldehydes 4a-l.** (2S,5S)-(−)-5-Benzyl-2-tert-butyl-3-methyl-4-imidazolidinone 3c (0.10 mmol) and trifluoroacetic acid (TFA) (0.10 mmol) were dissolved in the appropriate solvent (1 mL) and the excess of additive was evaporated under vacuum. After that, a solution of the \(\alpha,\beta\)-unsaturated aldehyde 2a-f (1.04 mmol) in the adequate solvent (2 mL) was added and the mixture was stirred for 30 min at the indicated temperature before the ylide 1a-b (0.52 mmol) was added. The reaction was next stirred at that temperature until full conversion. Afterwards the solvent was evaporated under vacuum and directly charged onto silica gel and subjected to flash column chromatography. The enantiomeric excess of the compounds were determined after transformation of the aldehydes 4a-l to the corresponding alcohols 5a-l. Racemic samples were prepared using a racemic mixture of the catalyst 3c.

General Procedure for the Reduction of Aldehydes (4a-l) into the Corresponding Alcohols (5a-l). The aldehyde 4a-l (0.38 mmol) was dissolved in dry THF (15 mL) at -78 °C and LiBH₄ (0.38 mmol) was added. After stirring the mixture during the necessary time the reaction was quenched with aqueous NH₄Cl (sat., 5 ml) and CH₂Cl₂ was added. The reaction was stirred for 30 min and then the aqueous layer was extracted with CH₂Cl₂ (3 × 25 mL) and the solvent was evaporated under vacuum. The crude was charged onto silica gel and subjected to flash column chromatography to obtain the alcohols 5a-l. Racemic samples were prepared reducing the racemic mixtures of the aldehydes 4a-l.

Determination of the Absolute Configuration.

The absolute configuration of the aldehyde 4d was determined by single-crystal X-ray analysis. The same stereochemistry was assumed for assigning the absolute configuration of the rest of the compounds.
