General remarks. Dichloromethane was freshly distilled from calcium hydride; THF and toluene were distilled from sodium (Na) under argon (Ar) atmosphere. Melting points were determined on a digital melting point apparatus and temperatures were uncorrected. $^1$H NMR and $^{13}$C NMR spectra were recorded on a Bruker AM-300 or AM-400 spectrophotometers. Infrared spectra were recorded on a Perkin-Elmer PE-983 spectrometer with absorption in cm$^{-1}$. Flash column chromatography was performed using 300-400 mesh silica gel. For thin-layer chromatography (TLC), silica gel plates (Huanghai GF$_{254}$) were used. Mass spectra were recorded by EI and ESI, and HRMS were measured on a HP-5989 instrument.
General procedure for the Me$_3$Si-promoted reaction of salicylic aldehyde with β-dicarbonyl compound.

To a stirred mixture of Me$_3$SiCl (5.0 mmol), NaI (5.0 mmol), β-dicarbonyl compound 1 (1.0 mmol) and CH$_3$CN (5 mL) was added salicylic aldehyde 2 (1.0 mmol) at ice-bath temperature. The reaction mixture was stirred at room temperature for 24 h. After addition of aqueous Na$_2$S$_2$O$_4$ to the reaction mixture, the organic layer was extracted with dichloromethane, washed with brine, dried over MgSO$_4$, and concentrated under reduced pressure. The residue was purified by chromatography on silica gel to obtain the 4H-benzopyran 3.
