I. Experimental details

1. Materials and methods

Unless otherwise noted, all reagents or solvents were obtained from commercial suppliers and used without further purification. All air and moisture sensitive reactions were carried out under an argon atmosphere. Dry CH2Cl2 was obtained by refluxing and distilling over CaH2 under nitrogen. Dry THF was distilled from sodium/benzophenone. Triethylamine was obtained by simple distillation. The 1H NMR and 13C NMR spectra were measured on Bruker 500 MHz or Bruker 300 MHz spectrometer. The measurements for 1H NMR and 13C NMR were performed at 300 MHz (DPX-300) or 500 MHz (DRX-500), and 75 MHz (DPX-300) or 125 MHz (DRX-500), respectively. Mass spectra were measured on a Bruker Daltonics Autoflex III MALDI TOF MS spectrometer. Fluorescence spectral measurements were carried out by using an Hitachi F-4600 fluorescence spectrophotometer. Electronic absorption spectra were recorded with Shimadzu UV-2550 spectrophotometers. Fluorescence lifetimes were determined by Edinburgh instrument laser impulse fluorometer with picosecond time resolution. Elemental analyses for C, H, and N were performed on a Vario MICRO elemental analyzer.

1.1 Quantum Yields determination

Fluorescence and absorption measurements were performed on Hitachi F-4600 fluorescence spectrophotometer and Shimadzu UV-2550 spectrophotometer. The slit width was 2.5 nm for excitation and 5.0 nm for emission. Determined the BODIPY segment of fluor, Zinc phthalocyanine in 1% pyridine in toluene (Φ = 0.30) were used as the standard for the fluorescent quantum yield calculation according to the absorption of the test sample, and the emission spectra area of the measured compound. Determined the bodipy segment of fluorescent, rhodamine 6G in EtOH (Φ = 0.88) were used as the standard for the fluorescent quantum yield calculation according to the absorption of the test sample, and the emission spectra area of the measured compound were obtained from 500 to 650 nm. Determined the 2-(thiophen-2-yl)quinoline segment fluorescent, Quinine sulfate (Φ = 0.55 in 0.1M H2SO4) were used as the standard for the fluorescent quantum yield calculation according to the absorption of the test sample, and the emission spectra area of the measured compound were obtained from 345 to 450 nm. The spectroscopic grade solvents and a 1 cm quartz cuvette were used. Dilute solutions (10-8 M) were used to minimize the reabsorption effects. The quantum yield of fluorescence were measured three times for each dye and averaged. Quantum yields were determined using the following equation:

\[ \Phi = \frac{S_1}{S_0} \]

\[ S_1 = \text{the area under the emission spectra of the measured compound, } S_0 = \text{the area under the emission spectra of the standard, } \]

\[ \Phi = \text{the absorbance at the excitation wavelength of the measured compound, } \]

\[ \Phi = \text{the absorbance at the excitation wavelength of the standard, } G = \text{the refractive index of the solvent used, } G = \text{the refractive index of the solvent of the standard, } M = \text{molar extinction coefficients were obtained from the slope of a graph of absorbance vs concentration for each dye with five different concentrations (10-8 M).} \]

1.2 X–Ray structure determination

The X-ray diffraction data were collected on a Bruker Smart CCD Apex DUO diffractometer with graphite monochromated Mo Kα radiation (λ = 0.71073 Å) using the ω-2θ scan mode. The data were corrected for Lorentz and polarization effects. The structure was solved by direct methods and refined on F2 by full-matrix least-squares methods using SHELXTL-2000. All calculations and molecular graphics were carried out on a computer using the SHELX-2000 program package and Diamond. A red block-like crystal of the approximate dimensions 0.28×0.24×0.22 mm3 was used. Monoclinic, space group P2(1)/c, a = 16.0905(14) Å, b = 10.5629(9) Å, c = 13.9165(12) Å, V = 1519.3(2) Å3, Z = 4, F(000) = 952, \( ρ = 1.341 \text{ Mgm}^{-3} \), \( 2θ_{\text{max}} = 56.62° \), \( R_1 = 0.0403, R_2 = 0.1036, \text{GOF} = 1.044, \text{residual electron density between 0.349 and -0.250 eÅ}^{-3}. \]

CCDC 856179 contains the supplementary crystallographic data for this paper. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/conts/retrieving.html (or from the Cambridge Crystallographic Data Centre, 12, Union Road, Cambridge CB21EZ, UK; fax: (+44) 1223-336-033; or deposit@ccdc.cam.ac.uk).

1.4 Cell culture and fluorescence bioimaging

The Michigan Cancer Foundation 7 (MCF-7) cell line was provided by the Institute of Biochemistry and Cell Biology, SIBS, CAS (China). Cells were grown in high glucose Dulbecco’s Modified Eagle Medium (DMEM, 4.5 g of glucose/L) supplemented with 10% FBS (fetal bovine serum) at 37 °C and 5% CO2. Cells (5×10⁵/L) were plated on 14 mm glass coverslips and allowed to adhere for 24 h. Experiments to assess Fe3+ uptake were performed over 1 h in the same medium supplemented with 50 µM FeCl3.

Immediately before the experiments, cells were washed with PBS buffer and then incubated with 10 µM 2 in PBS for 30 min at 37 °C. Cell imaging was then carried out after washing the cells with PBS. Confocal fluorescence imaging was performed with a Zeiss LSM 710 laser scanning microscope and a 63×oil-immersion objective lens. Cells incubated with 2 excited at 405 nm and 488 nm using a multi-line argon laser.
I.5 Synthesis section

2-(thiophen-2-yl)quinoline (4) was synthesised by reference S2. White solid; 84% yield. 1H NMR(CDCl3, 300 MHz): 8.15-8.09 (m, 2H), 7.81-7.75 (m, 3H), 7.70 (t, 1H, J = 3.0 Hz), 7.50-7.47 (m, 2H), 7.16 (t, 1H, J = 3.0 Hz).

5-(quinolin-2-yl)thiophene-2-carbaldehyde (3) The 2-(thiophen-2-yl)quinoline (4) (4.6 g, 21.75 mmol) was dissolved in dry THF (50 mL) under an argon atmosphere. The n-butyl lithium (14.95 mL, 23.93 mmol) was slowly added and the mixture solution was stirred for 30 min at -78 °C. Dry N,N-dimethylformamide (1.59 mL) was added and stirred for an additional 12 h at ambient temperature. The reaction mixture was washed twice with 50 mL water and 50 mL brine, dried over the anhydrous magnesium sulfate, and concentrated at reduced pressure. The crude product was recrystallized with ethyl acetate.

Compound 3: yellowy solid; 59.05% yield; m.p.: 143 °C. 1H NMR(CDCl3, 300 MHz): 9.96 (s, 1H), 8.22 (d, 1H, J = 3.0 Hz), 8.14 (d, 1H, J = 3.0 Hz), 7.85-7.73 (m, 4H), 7.75 (d, 1H, J = 6.0 Hz), 7.56 (d, 1H, J = 6.0 Hz). 13C NMR(CDCl3, 75 MHz): 117.7, 126.1, 127.1, 127.6, 127.8, 129.6, 130.3, 136.8, 137.0, 144.8, 148.1, 150.8, 154.3, 183.2. EI-TOF MS: m/z: 239.9 (M +).

8-[5-(quinolin-2-yl)thiophene]-4,4-difluoro-1,3,5,7-tetramethyl-4-bora-3a,4a-diaza-s-indacene (2) The 2,4-dimethyl-pyrrole (480 mg, 5.02 mmol) and 5-(quinolin-2-yl)thiophene-2-carbaldehyde (3) (600 mg, 2.52 mmol) were dissolved in dry CH2Cl2 (100 mL) under an argon atmosphere. One drop of trifluoroacetic acid (TFA) was added, and the solution was stirred for 10 h at ambient temperature in the dark (until TLC indicated complete consumption of the aldehyde). The 2,3-dichloro-5,6-dicyanoquinone (DDQ, 560 mg, 2.52 mmol) was added, and the mixture was stirred for an additional 3 h. The reaction mixture was then treated with triethylamine (6 mL) for 5 min. Boron trifluoride etherate (6 mL) was added and the mixture was stirred for another 40 min. The dark brown reaction mixture was washed twice with 50 mL water and 50 mL brine, dried over Na2SO4, and concentrated at reduced pressure. The crude product were purified by silica-gel column chromatography (dichloromethane/petroleum ether:1/2) and recrystallized with dichloromethane/hexane.

Compound 2: red solid; 65% yield; m.p. > 250 °C; 1H NMR(CDCl3, 500 MHz): 8.19 (d, 1H, J = 10.0 Hz), 8.08 (d, 1H, J = 10.0 Hz), 7.81 (m, 2H), 7.76 (d, 1H, J = 3.5 Hz), 7.71 (t, 1H, J = 5.0 Hz), 7.51 (t, 1H, J = 5.0 Hz), 7.04 (d, 1H, J = 5.0 Hz), 6.02 (s, 2H), 2.57 (s, 6H), 1.76 (s, 6H); 13C NMR (CDCl3, 125 MHz): 156.3, 151.6, 148.1, 147.7, 143.5, 137.7, 136.8, 132.3, 130.1, 129.4, 128.9, 127.5, 125.8, 125.8, 121.6, 117.3, 14.7, 14.0. MALDI-TOF MS: m/z: 457.4(M +). Anal. Calcd for C26H22BF2N3S; C, 68.28; H, 4.85; N, 9.19; found C,68.23; H,4.91; N,9.16.

8-[5-(quinolin-2-yl)thiophene]-4,4-difluoro-1,3,5,7-tetra(4-methoxystyryl)-4-bora-3a,4a-diaza-s-indacene (1) Compound 2 (0.22 mmol, 100 mg) and methoxy benzaldehyde (1.12 mmol, 152 mg) were added to a 100 mL round bottomed flask containing 50 mL toluene, and then piperidine (0.4 mL) and acetic acid (0.4 mL) were added to this solution. The mixture was heated under reflux by using a Dean Stark trap and reaction was monitored by TLC in solvent CH2Cl2. When all the starting material had been disappeared, the mixture were cooled to room temperature and concentrated at reduced pressure. The dark brown reaction mixture was washed with 100 mL water and extracted twice with 100 mL chloroform., dried over Na2SO4, and concentrated at reduced pressure. The crude product were purified by silica-gel column chromatography using CH2Cl2 as the eluant and recrystallized with dichloromethane/hexane.

Compound 1: black solid; 10%; m.p. > 250 °C; 1H NMR(CDC13, 500 MHz): 8.29 (d, 1H, J = 10.0 Hz), 8.12 (d, 1H, J = 10.0 Hz), 7.95 (m, 2H), 7.87 (d, 1H, J = 10.0 Hz), 7.73 (t, 1H, J = 10.0 Hz), 7.68 (d, 2H, J = 15.0 Hz), 7.65 (d, 4H, J = 10.0 Hz), 7.55 (t, 1H, J = 10.0 Hz), 7.39 (d, 2H, J = 15.0 Hz), 7.11 (s, 2H), 7.06 (d, 4H, J = 10.0 Hz), 6.97 (d, 4H, J = 5.0 Hz), 6.94 (d, 2H, J = 15.0 Hz), 6.51 (d, 4H, J = 10.0 Hz), 6.21 (d, 2H, J = 15.0 Hz), 3.88 (s, 6H), 3.61 (s, 6H); 13C NMR (CDCl3, 125 MHz): 160.6, 159.5, 153.8, 151.3, 148.7, 148.6, 148.4, 142.4, 138.8, 137.0, 136.6, 134.6, 131.7, 131.6, 130.2, 130.0, 129.7, 129.6, 129.3, 128.0, 127.6, 127.5, 126.7, 126.2, 119.4 117.3, 117.2, 114.4, 113.9, 111.2, 55.4, 55.1. MALDI-TOF MS: m/z: 929.5(M+).
