**Experimental Section**

**General.** All commercially available chemicals were purchased from appropriate sources and used as received unless otherwise mentioned. 5,15-Bis(4-methoxycarbonylphenyl)porphyrin, 5,10,15,20-Tetrakis(4-methoxycarbonylphenyl)porphyrin and 5,10,15,20-tetrakis(3,5-diethoxycarbonylphenyl)porphyrin were synthesized and characterized with modified procedures reported in the literature. All $^1$H NMR measurements were performed on a JEOL EX270 and JEOL EX400 spectrometers. UV-vis absorption spectra were measured in spectroscopic-grade solvents on a Shimadzu UV-3600 spectrophotometer at room temperature. Fluorescence spectra were recorded on a Hamamatsu Photonics C9920-02 spectrometer at room temperature. MALDI-TOF-MS spectra were measured on a Bruker UltrafleXtreme-TN MALDI-TOF/TOF spectrometer using dithranol as a matrix.

**Synthesis.**

**Copper(II) 5,15-bis(4-methoxycarbonylphenyl)porphyrinato:** 5,15-bis(4-methoxycarbonylphenyl)porphyrin (47 mg, 6.5 µmol) was dissolved in CHCl₃ (50 mL) and to the solution was added the suspension of Cu(OAc)$_2	ext{H}_2$O (49.6 mg, 0.25 mmol) in methanol (5 mL) and the mixture was refluxed for 45 min. The volatile was evaporated to dryness under vacuum and the residue was dissolved in CHCl₃ (25 mL). The solution was washed with water (25 mL) to remove excess copper salt and dried over Na₂SO₄.
The crude product was purified on a silica gel column by eluting with CHCl₃ and the collected fraction was evaporated to dryness to yield reddish-purple powder. The obtained powder was dried under vacuum for 5 h. Yield: 50 mg (100%). UV-vis (CHCl₃): \( \lambda_{\text{max}} \) [nm] = 417, 540. **TG/DTA measurements and N_2 isotherm.**
TG/DTA data were recorded on an SII TG/DTA 7200 instrument. Each sample (~1.0 mg) was heated from 25 °C to 400 °C with a ramp rate of 2 °C/min. A certain amount (~1.0 mg) of γ-Al_2O_3 was used as a reference for DTA measurements. Nitrogen adsorption-desorption at -196 °C was performed with a Belsorp-mini (BEL Japan, Inc.) within a relative pressure range from 0.01 to 101.3 kPa. A sample mass was used for adsorption analysis after pretreatment at 80 °C for 30 min under vacuum conditions and kept in N_2 atmosphere until N_2-adsorption measurements. The sample was exposed to a mixed gas of He and N_2 with a programmed ratio and adsorbed amount of N_2 was calculated from the change of pressure in a cell after reaching the equilibrium (at least 5 min).

**X-ray crystallography**
The crystal structures of diprotonated forms of 1, 2, 3, and 4, were determined by X-ray crystallography. The single crystals were mounted on mounting loops. All diffraction data were collected by using a Bruker APEXII diffractometer at −153 °C equipped with graphite-monochromated Mo Kα (λ = 0.71073 Å) by the ω-2θ scan. The structures
were solved by direct methods by using SIR97 and SHELX-97. Crystallographic data for these compounds are summarized in Table S1. CCDC-866776 ([H$_2$I](ClO$_4$)$_2$), -866777 ([H$_2$J](ClO$_4$)$_2$), -866778 ([H$_2$K](ClI)$_2$), and -866779 ([H$_2$L]Cl) contain the supplementary crystallographic data. In the structure refinements, we could not determine the exact positions of the solvent molecules of crystallization because of their severe disorder. Their contribution was thus subtracted from the diffraction pattern by the “Squeeze” program. These data can be obtained free of charge from the Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.
