General

THF was pre-dried over 4 Å molecular sieves and distilled under argon atmosphere from sodium benzophenoneketyl immediately prior to use. CH$_2$Cl$_2$ was heated under reflux with MgSO$_4$ and distilled before used. The starting material of 4-p-tolyl-1,2,3,3a,4,8b-hexahydrocyclopenta[b]indol-7-ylboronic acid, 3,6-bis(4-bromo-phenyl)-2,5-dibutylypyrrolo[3,4-c]pyrrole-1,4(2H,5H)-dione and 3,6-bis(4-bromophenyl)-2,5-bis(2-ethylhexyl)pyrrolo[3,4-c]pyrrole-1,4(2H,5H)-dione were prepared according to published procedures.$^{[1, 2]}$ All other solvents and chemicals used in this work were of reagent grade and used without further purification.

Cell Fabrication

The DSCs were fabricated as follows. A double-layer TiO$_2$ photoelectrode (thickness 15 μm; area 0.25 cm$^2$) was used as a working electrode. A 10 μm main transparent layer with titania particles (~20 nm) and a 6 μm scattering layer with titania particles (~400 nm) were screen-printed on the fluorine-doped tin oxide conducting glass substrate. A solution of TD01 or YCD01 (3 × 10$^{-4}$ M) in acetonitrile/tert-butyl alcohol (1/1, v/v) was used to coat the TiO$_2$ film with the dye. Deoxycholic acid (20 mM) was added to the dye solution as a co-adsorbent. The electrodes were immersed in the dye solutions and then kept at 25 °C for 24 h to adsorb the dye onto the TiO$_2$ surface. Photovoltaic measurements were performed in a two-electrode sandwich-type sealed-cell configuration. The dye-coated TiO$_2$ film was used as the working electrode, and platinum-coated conducting glass was used as the counter-electrode. The two electrodes were separated by a Surlyn spacer (50 μm thick) and sealed up by heating the polymer frame. Finally, the electrolyte consisting of 0.6 M 1-methyl-3-propylimidazolium iodide, 0.1 M LiI, 0.05 M I$_2$ and 0/0.5 M tert-butylpyridine in acetonitrile was injected into the cell and sealed with a coverglass. The current-voltage characteristics were measured using a black metal mask with an aperture area of 0.25 cm$^2$ under standard AM 1.5 sunlight (100 mW cm$^2$, WXS-155S-10: Wacom Denso Co. Japan) [3]. Monochromatic
incident photon-to-current conversion efficiency spectra were measured with monochromatic incident light of $1 \times 10^{16}$ photons cm$^{-2}$ under 100 mW cm$^{-2}$ in director current mode (CEP-2000BX, Bunko-Keiki).
