I. General Methods and Materials. Unless stated otherwise, reactions were performed in flame-dried glassware under a positive pressure of nitrogen. Analytical thin layer chromatography (TLC) was performed on precoated silica gel 60 F\textsuperscript{254} plates and visualization on TLC was achieved by UV light (254 and 354 nm). Flash column chromatography was undertaken on silica gel (400-630 mesh). \textsuperscript{1}H NMR was recorded on 300 MHz or 400 MHz and chemical shifts were quoted in parts per million (ppm) referenced to the appropriate solvent peak or 0.0 ppm for tetramethylsilane. The following abbreviations were used to describe peak splitting patterns when appropriate: br = broad, s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, dd = doublet of doublet, td = doublet of triplet. Coupling constants, $J$, were reported in hertz unit (Hz). \textsuperscript{13}C NMR was recorded on 100 MHz and was fully decoupled by broad band proton decoupling. Chemical shifts were reported in ppm referenced to the center line of a triplet at 77.0 ppm of Chloroform-d. High-resolution mass spectrometry (HRMS) data were recorded on LC-TOF. Unless otherwise stated, all commercial reagents and solvents were used without additional purification.

II. Experimental Procedure

General procedure (GP): Chromone derivative (0.088 mmol), quinone (4 equiv), Pd(OAc)$_2$ (0.2 equiv), AgOAc (2.5 equiv) and PivOH (2 equiv) were combined in dioxane (1mL) in a cap test tube. The reaction mixture was heated to 100 °C. The reaction was stirred for 12–24 h until the starting material, chromone derivative disappeared (monitored by TLC using EtOAc and $n$-hexane = 1:3 as the mobile phase). After cooled to RT, the dioxane solvent was removed under reduced pressure. The reaction mixture was diluted with CH$_2$Cl$_2$ and the aqueous NaHCO$_3$ was added to neutralize the PivOH. After stirring the mixture for 10 min, the residue was extracted with aqueous NH$_4$Cl (3×30 ml). The organic layer was dried over MgSO$_4$. After removal of solvent, the residue was purified by flash chromatography on silica gel to give desired product.
