General: The solvents used are of commercial grade. Compound 2, 3, 9 and 10 were synthesized by following the procedures reported. Column chromatography was performed on the silica gel (standard grade, 60A, Sorbtech). $^1$H and $^{13}$C NMR were recorded on the Brucker DRX 300 MHz and Brucker Avance III 400 MHz. MALDI-TOF mass spectra were recorded on a PerSeptive Voyager STR MS spectrometer. UV/Vis spectra were recorded on a Cary 100 Bio UV-Vis spectrophotometer, and fluorescence spectra were recorded on a Cary Eclipse fluorescence spectrophotometer.

Photostability
To test the photostability of the quaterylene dendrimers, we compared the photobleaching behavior of QR-G1-COOH and QR-G2-COOH with that of indocyanine green (ICG), a commercially available and FDA approved NIR dye (Sigma-Aldrich, CAS: 3599-32-4). Solutions of the respective dyes with initial absorbance of 1.2 at maximum absorption wavelength in DMSO were kept in capped clear glass vials and exposed to ambient light. The absorption spectra of the dyes solutions were recorded in 1 cm quartz cuvettes (3 ml) over time. Figures S2 shows the absorption spectra of QR-G1-COOH, QR-G2-COOH and ICG over time.

Quantum yield measurement:
Fluorescence quantum yield was measured following the method reported, and ICG in methanol was used as a reference standard.

Cytotoxicity

The cytotoxicity of QR-G1-COOH and QR-G2-COOH against the wt-DBT cells was assessed by a Hemocytometer-based trypan blue dye exclusion method.6 Wt-DBT cells were seeded in two 24-well plates at density of ~7×10^4 cells/mL/0.5 mL (for 24 hours test) and 4×10^4 cells/mL/1 mL (for 48 hours test). After 24 hours incubation, the culture medium was removed and the cell culture medium containing test substances was immediately applied to the each well. The negative control group was treated with medium only, 1.6 % DMSO was used as solvent control group, and the positive control group was treated with 5% DMSO. To measure the viable cells, the cells from all the test groups were harvested after 24 or 48 hours by trypsinization using a 0.05% trypsin–EDTA solution and the viable cells were then determined by trypan blue dye exclusion using Hemacytometer.
