I) Syntheses and Experimental Data

A) General Information

A.1) Chemicals
Chemicals were obtained from ABCR, Acros Organics, Alfa Aesar, Merck, Sigma-Aldrich or VWR. Commercially available reagents and starting materials were, unless mentioned otherwise, used without further purification. Solvents which were to be used in moisture-sensitive experiments were taken from a solvent drying system by M. Braun (type: MB SPS-800) and stored under an argon atmosphere. Other solvents were used after single distillation.

For reactions including oxygen- or moisture-sensitive reagents, glassware was baked out under high-vacuum conditions and procedures carried out under an argon atmosphere. Reagents were injected via a septum or added under argon counterflow.

A.2) Appliances and Materials
Thin layer chromatography (TLC) was performed on plates from Merck (silica gel 60, F254). Detection of the substances was obtained by fluorescence detection under UV light (wavelength λ = 254 nm). The corresponding Rf values and solvents used as eluents are listed in the experimental part. Column chromatographies were performed with silica gel (grain size 0.04-0.063 cm, Merck, Si60) at approximately 1.5 atm (hand pump). The used eluent relations are listed with the respective experiments.

Nuclear magnetic resonance spectra (NMR-spectra) were obtained on instruments of the type AV-250 (for 1H-spectra), AV-360 (for 1H- and 13C-spectra), AV-500 (for 1H-spectra) or AV-500c (for 1H- and 13C-spectra) from Bruker. Chemical shifts (δ) are given as parts per million (ppm) and refer to the shift of the hydrogen or carbon atoms in the solvents used (CDCl3, CD3CN). The following abbreviations were used for the assignment of the signals and their multiplicities: s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet). The given coupling constants J are listed as the average of the experimental findings.

Mass spectrometry spectra (MS-spectra) were obtained by using electron ionization (EI) or electrospray ionization (ESI). Assigned m/z-relations are listed in ascending order. ESI-spectra were measured on a Finnigan LCQ classic or a 500-MS LC Ion Trap Mass Spectrometer by Varian. EI-spectra were measured on a MAT 8200 by Finnigan.
Infrared-spectra (IR-spectra) were measured on a JASCO IR-4100 spectrometer directly from the substance via attenuated total reflectance (ATR-IR). The signals are labelled with the following abbreviations: vs (very strong), s (strong), m (medium), w (weak), vw (very weak).

**B) Syntheses**

**B.1) Starting Materials**

$N$-iodomorpholine-hydrogen iodide$^{[I-1]}$, $N$-ocytlazide$^{[I-2]}$, ($R$)-1-phenyl-azidoethane$^{[I-3]}$, tris[(1-benzyl-1H-1,2,3-triazol-4-yl)methyl]amine (TBTA)$^{[I-4]}$, 1,3-bis(ethynyl)benzene$^{[I-5]}$ and 1,3,5-tris(ethynyl)benzene$^{[I-6-1][I-5b]}$ were prepared according to previously reported procedures.

**B.2) General Methods**

**General procedure A for the synthesis of the applied iodoalkynes:**

1,3-bis(iodoethynyl)benzene:

1,3-diethynylbenzene (0.63 g, 5 mmol) was dissolved in THF (20 mL) and treated with CuI (0.96 g, 0.5 mmol, 10 mol%) and $N$-iodomorpholine (3.74 g, 11 mmol, 2.2 eq.). The reaction mixture was stirred at room temperature for 2 hours, after which a fine white precipitate had formed. The suspension was poured onto a pad of neutral alumina and the filtrate was collected under vacuum. The solid phase was washed with DCM (4x100mL) the organic fractions were combined, washed with 20 mL of saturated Na$_2$S$_2$O$_3$ and dried over sodium sulfate. The organic fraction were concentrated in vacuo and recrystalized from hexane to afford 1.58 g (83%) of 1,3-bis(iodoethyl)benzene as a yellow solid.

**General procedure B for the synthesis of bis- or tris(iodotriazolyl)benzenes:**

1,3-bis(1-benzyl-5-iodo-1H-1,2,3-triazol-4-yl)benzene (1,3-I$_{1Bn}$):

Following a modified procedure of Sharpless and Fokin el al.$^{[I-7]}$, CuI (0.03 g, 0.16 mmol, 10 mol%) and TBTA (0.83 g, 0.16 mmol, 10 mol%) were dissolved in 8 mL of dry and degassed THF. The reaction mixture was stirred for 2 hours at room temperature until a homogeneous clear solution was obtained. The above solution was added to a solution of 1,3-bis(2-iodoethyl)benzene (0.60 g, 1.58 mmol) in 2 mL THF. Benzyl azide (0.396 mL, 3.17 mmol, 2 eq.), dissolved in 2 mL THF were added to this reaction mixture over a period of 10 to 20 minutes. The sample was allowed to stir for 18 hours at room temperature in the dark. After removal of the solvent, the residue was taken up in 20 mL ethyl acetate, washed subsequently with 2 mL of 5 % NH$_4$OH solution, 20 mL water and 20 mL brine and
dried over sodium sulfate. The solvent was removed in vacuo and the residue was purified by flash column chromatography. Recrystallization of the crude product from ethyl acetate and diethyl ether yields 0.66 g (65%) 1,3-bis(1-benzyl-5-iodo-1H-1,2,3-triazol-4-yl)benzene as a white solid.

**General procedure C for the methylation of bis- or tris(iodotriazolyl)benzenes:**

**4,4'-(1,3-phenylene)bis(1-benzyl-5-iodo-3-methyl-1H-1,2,3-triazol-3-ium) triflate (1,3-IBn\textsuperscript{Br}/OTf):**

To a solution of 1,3-bis(1-benzyl-5-iodo-1H-1,2,3-triazol-4-yl)benzene (0.13 g, 0.2 mmol) in 5 mL of dry dichloromethane was added methyl triflate (88.00 µL, 0.80 mmol, 4 eq.) over a period of 10 to 20 minutes. The sample was allowed to stir for 2 days at room temperature in the dark. The solvent was removed in vacuo and the residue was recrystallized twice from acetonitrile and diethyl ether to afford 0.12 g (61%) 4,4'-(1,3-phenylene)bis(1-benzyl-5-iodo-3-methyl-1H-1,2,3-triazol-3-ium) triflate as a white solid.

**General procedure D for anion-cross-metathesis:**

**4,4'-(1,3-phenylene)bis(1-benzyl-5-iodo-3-methyl-1H-1,2,3-triazol-3-ium) hexafluorophosphate (1,3-IBn\textsuperscript{Br}/PF\textsubscript{6}):**

To a solution of 4,4'-(1,3-phenylene)bis(1-benzyl-5-iodo-3-methyl-1H-1,2,3-triazol-3-ium) triflate (0.12 g, 0.12 mmol) in 1.5 mL freshly distilled methanol was added sodium hexafluorophosphate (0.06 g, 3eq). The sample was allowed to stir for 2 days at room temperature in the dark. The white precipitate was filtered, washed with small amounts of cold diethyl ether and methanol, and recrystallized from acetonitrile and diethyl ether to afford 0.09 g (82%) 4,4'-(1,3-phenylene)bis(1-benzyl-5-iodo-3-methyl-1H-1,2,3-triazol-3-ium) hexafluorophosphate as a white solid.
C) Experimental Data

C.1) 1,3-bis(iodoethynyl)benzene

The compound was synthesized by general procedure A.

Yield: 83% (yellow solid)

$^1$H-NMR (500 MHz, CDCl$_3$): $\delta = 7.50$ (s, 1 H), 7.40-7.35 (m, 2H), 7.29-7.23 (m, 1H) ppm.

$^{13}$C-NMR (125 MHz, CDCl$_3$): $\delta = 136.1, 132.1, 128.3, 123.6, 110.6, 93.1$ ppm.

Elemental analysis:

\[
\begin{array}{lll}
\text{calc.:} & \text{C: 31.78} & \text{H: 1.07} \\
\text{found:} & \text{C: 31.83} & \text{H: 1.04} \\
\end{array}
\]

IR (ATR): $\nu = 3292, 2928, 2856, 1679, 1649, 1588, 1569, 1478, 1411, 1249, 1091, 937, 898, 847, 789, 688$ cm$^{-1}$.

EI-MS: $m/z = 377.82$ [M]$^+$

C.2) 1,3,5-tris(iodoethynyl)benzene
The compound was synthesized by general procedure A. 20 mol\% of copper iodide and 3.3 equivalents of \textit{N}-iodomorpholine were used. The sample was stirred for 3h.

Yield: 90\% (yellow solid)

$^1$H-NMR (500 MHz, CDCl$_3$): $\delta = 7.42$ (s, 3 H) ppm.

$^{13}$C-NMR (125 MHz, CDCl$_3$): $\delta = 135.8, 123.9, 92.4$ ppm.

Elemental analysis:  
\begin{align*}
\text{calc.:} & \quad C: 27.30 \quad H: 0.57 \\
\text{found:} & \quad C: 27.33 \quad H: 0.51
\end{align*}

IR (ATR): $\nu = 2837, 2344, 2103, 1697, 1572, 1413, 1356, 1220, 1167, 979, 872, 669$ cm$^{-1}$.

EI-MS: m/z = 276.1 [\text{M – 2I}]^{2+}

C.3) 1,3-bis(1-benzyl-1H-1,2,3-triazol-4-yl)benzene (1,3-H$_{Bn}$)

The compound was synthesized by general procedure B.

Yield: 64\% (white solid)

$R_f$ (pentane/EtOAc = 1:1): 0.52

$^1$H-NMR (500 MHz, CDCl$_3$): $\delta = 8.10$ (m, 1H); 7.82-7.82 (m, 2H), 7.76 (s, 2H); 7.43-7.40 (m, 1H), 7.41-7.35 (m, 10H), 5.62 (s, 4H) ppm.

$^{13}$C-NMR (125 MHz, CDCl$_3$): $\delta = 147.8, 134.6, 131.2, 129.2, 128.9, 128.2, 125.4, 122.8, 119.7, 54.3$ ppm.
Elemental analysis:  
\[ \text{calc.: C: 73.45 H: 5.14 N: 21.41} \]
\[ \text{found: C: 73.40 H: 5.20 N: 21.40} \]

CuI (0.04 g, 0.23 mmol, 20 mol%) and TBTA (0.12 g, 0.23 mmol, 20 mol%) were dissolved in 6 mL of dry and degassed THF. The reaction mixture was stirred for 2 hours at room temperature until a homogeneous clear solution was obtained. The above solution was added to a solution of 1,3,5-tris(iodoethynyl)benzene (0.611 g, 1.16 mmol) in 2 ml THF. Benzyl azide (0.43 mL, 3.44 mmol, 3 eq.), dissolved in 2 ml THF were added to this reaction mixture over a period of 20 minutes. The sample was allowed to stir for 18 hours at room temperature in the dark. The reaction was quenched with 2 mL of 5 % NH$_4$OH solution, the solvent as removed in vacuo and the residue was suspended in water and diethylether. A precipitate formed upon vigorous stirring, which was filtrated, dried, dissolved in acetone and again filtrated. The solvent was removed in vacuo and the residue was further purified by flash column chromatography yielding 0.57 g (54%) 1,3,5-tris(1-benzyl-5-iodo-1H-1,2,3-triazol-4-yl)benzene as an off-white solid.

Yield: 54% (off-white solid)

$R_f$ (EtOAc/MeOH = 10:1): 0.19

D) NMR Experiments

General procedure for the NMR experiments of Table X
From stock solutions (in CD$_3$CN), the respective substrate (10.0 µmol, 1.0 equiv.) and, if applicable, the activating reagent (10.0 µmol, 1.0 equiv.) as well as pyridine (1.0 µmol, 0.1 equiv.) were mixed in an NMR tube, and the solution was filled up to an overall volume of 0.60 mL. All experiments were started simultaneously and the yield was determined by NMR spectroscopy after approx. 0, 3, 6, 12, 18, 24, 36, 48, 72, and 96 h of reaction time.

Analysis of the spectra (determination of the yield of X)

The yield was determined from the ratio of the product peak (doublet between 6.15 and 6.30 ppm, depending on the coordination with activating reagent or H$^+$) to the methylene peak of tetraethylsilane (quartet at 0.52 ppm). In the experiments with pyridine, the additional formation of trace amounts of benzhydryl pyridinium salt was accounted for.
E) **Selected $^1$H-NMR Spectra of the Ritter-like Reaction**

**Benzhydryl bromide**

**N-Benzhydryl acetamide**
# 3 (see Table 1) after 0 h

# 3 (see Table 1) after 24 h
# 3 (see Table 1) after 48 h

# 3 (see Table 1) after 96 h
II) Kinetics of the Ritter-like Reactions (Graphic representations)

All important experiments have been replicated several times. The estimated error of measurement is approx. 5%.

IV) X-Ray Structural Analysis

General:
The data were collected on an X-ray single crystal diffractometer equipped with a CCD detector (APEX II, $\kappa$-CCD), a rotating anode (Bruker AXS, FR591) with MoK$_{\alpha}$ radiation ($\lambda = 0.71073$ Å), and a graphite monochromator by using the SMART software package.$^{[I-8]}$ The measurements were performed on single crystals coated with perfluorinated ether. The crystal was fixed on the top of a glass fiber and transferred to the diffractometer. A crystal from 1,3-I$_{\text{Bu}}$/OTf was frozen under a stream of cold nitrogen. A matrix scan using three short runs was used to determine the initial lattice parameters. Reflections were merged and corrected for Lorenz and polarization effects, scan speed, and background using SAINT.$^{[I-9]}$ Absorption corrections, including odd and even ordered spherical harmonics, were performed using SADABS.$^{[I-9]}$ Space group assignments were based upon systematic absences, $E$ statistics, and successful refinement of the structures. Structures were solved by direct methods with the aid of successive difference Fourier maps and were refined against all data using WinGX$^{[I-14]}$ based on SIR-92.$^{[I-10]}$ Methyl hydrogen atoms treated as a part of rigid rotating groups, with C–H = 0.98 Å and U$_{\text{iso(H)}}$ = 1.5·U$_{\text{eq(C)}}$. Other H atoms were placed in calculated positions and refined using a riding model, with methylene and aromatic C–H distances of 0.99 Å and 0.95 Å, respectively, and U$_{\text{iso(H)}}$ = 1.2·U$_{\text{eq(C)}}$. If not mentioned otherwise, non-hydrogen atoms were refined with anisotropic displacement parameters. Full-matrix least-squares refinements were carried out by minimizing $\sum w(F_o^2-F_c^2)^2$ with SHELXL-97$^{[I-12]}$ weighting scheme. Neutral atom scattering factors for all atoms and anomalous dispersion corrections for the non-hydrogen atoms were taken from International Tables for Crystallography.$^{[I-11]}$ Images of the crystal structures were generated by PLATON.$^{[I-13]}$

Reflection Data:
- 65121 reflections were integrated and scaled
- 935 reflections systematic absent and rejected
- 64186 reflections to be merged
- 6311 independent reflections
- 0.026 R\( \text{wp} \); (basis \( F_\sigma \))
3611 independent reflections (all) were used in refinements
6137 independent reflections with \( I_o > 2\sigma(I_o) \)
99.7 % completeness of the data set
453 parameter full-matrix refinement
13.9 reflections per parameter

Solution:
Direct Methods\(^\text{[I-10]}\); Difference Fourier syntheses

Refinement Parameters:
In the asymmetric unit:
50 Non-hydrogen atoms with anisotropic displacement parameters

Hydrogen Atoms:
In the difference map(s) calculated from the model containing all non-hydrogen atoms, not all of the hydrogen positions could be determined from the highest peaks. For this reason, the hydrogen atoms were placed in calculated positions (\( d_{C-H} = 95, 98, 99 \) pm). Isotropic displacement parameters were calculated from the parent carbon atom (\( U_H = 1.2/1.5 U_C \)). The hydrogen atoms were included in the structure factor calculations but not refined.

Atomic Form Factors:
For neutral atoms and anomalous dispersion \(^\text{[I-11]}\)

Extinction Correction:
no

Weighting Scheme:
\( w^{-1} = \sigma^2(F_o^2)+(a*P)^2+b*P \)
with a: 0.0175; b: 6.2834; P: [Maximum(0 or \( F_o^2 \))+2*\( F_c^2 \)]/3

Shift/Err:
Less than 0.001 in the last cycle of refinement:

Resid. Electron Density:
+1.51 e/Å\(^3\); -0.69 e/Å\(^3\)

R1:
\( \sum |F_o|-|F_c|/|F_o| \) = 0.0223
\( \sum |F_o|-|F_c|/\sum |F_o| \) = 0.0230

wR2:
\( \sum w(F_o^2-F_c^2)^2/\sum w(F_o^2) \) = 0.0526
\( \sum w(F_o^2-F_c^2)^2/\sum w(F_o^2) \) = 0.0530

Goodness of fit:
\( \sum w(F_o^2-F_c^2)^2/(N_O-N_V) \) = 1.107

Remarks:
Refinement expression \( \sum w(F_o^2-F_c^2)^2 \)

References:

V) **DFT Calculations on the possible Threefold Coordination of Bromide to the Tridentate Activator**

In order to test the viability of a threefold coordination of the substrate to tridentate activators like $\text{1,3,5-IBn/OTf}$, we performed orientating DFT calculations on model systems. To this end, we replaced the benzyl substituents on the triazolium moieties of 1,3,5-IBn/OTf with methyl groups and we also used bromide as a prototypical XB acceptor (i.e. as a replacement for benzhydryl bromide; this, at the same time, represents the complex formed after the abstraction of bromide from the substrate). For these orientating investigations, the M06-2X functional$^{[I-15]}$ was used with the triple-zeta TZVPP basis set$^{[I-16]}$ on all atoms (employing the corresponding pseudopotential on the iodine atoms). The Gaussian09$^{[I-17]}$ suite of programs was used for the calculations.

A tridentate minimum structure was obtained that is shown in Figures F2 and F3 below. The identity of the minimum was confirmed by the absence of imaginary frequencies. The corresponding I-Br distances are 3.13 Å, with C-I-Br angles of 163°. The triazolium moieties are slightly bent towards the bromide (with an angle of about 13°), but the energetic penalty for this seems to be less than the interaction energy gained by the third complexation.

![Figure F2](https://example.com/f2.png)
