1. **General Comments.** Unless otherwise indicated, all manipulations were carried out using standard Schlenk and glove box techniques under nitrogen atmosphere. All solvents used for experiments were dried to water contents of less than 10 ppm (determined using a Mettler Toledo C20 coulometric Karl Fischer titrator) by passage through activated aluminum oxide columns (MBraun SPS) and freeze–thaw-degassed. All starting materials, including 3-bromoanisol, CuBr, imidazole, methyl trifluoromethanesulfonate, BuLi, Ph$_2$PCl, were purchased from Aldrich and used without further purification. Previous reports have described the syntheses of 3-methoxyphenyl-imidazole$^1$ and NiBr$_2$(NC$_{3}$Pr)$_2$. NMR chemical shift values are reported in ppm ($\delta$) and referenced internally to the residual solvent signals ($^1$H and $^{13}$C: 7.26 and 77.16 ppm for CDCl$_3$; 7.16 and 128.06 ppm for C$_6$D$_6$) or externally ($^{31}$P, H$_3$PO$_4$ in D$_2$O, $\delta$ = 0). Coupling constants are reported in Hz. High Resolution Mass Spectroscopy analyses were performed by the Centre Regional de Spectroscopie de Masse – Université de Montréal, and the Laboratoire de Chimie de Coordination du CNRS – Toulouse. The elemental analyses were performed by the Laboratoire de Chimie de Coordination du CNRS – Toulouse.

2. **Synthetic Procedures.** Details of the synthesis and characterization of the new compounds reported in the accompanying communication are provided below. All compounds are identified by their respective IUPAC names as well as the acronyms used to refer to them in the communication. In addition, we have provided a line-drawing for each compound to facilitate spectral assignments. It
should be noted that the numbering scheme used in these drawings are consistent with that used in the molecular views of the solid structures of complexes 3-5 (Figure 1 in the manuscript).

3-[2-(Diphenylphosphanyl)-1H-imidazol-1-yl]phenyl diphenylphosphinite, PIMC\textsuperscript{HOP} (2):

Drop-wise addition of BuLi (5.0 mL of a 2 M solution in cyclohexane, 10 mmol) to a solution of 3-hydroxyphenyl-imidazole 1 (800 mg, 5.0 mmol) in THF (75 mL) at –78 °C gave a pink suspension, which was allowed to warm to room temperature before adding ClPPh\textsubscript{2} (1.80 mL, 10.0 mmol). The resulting yellow solution was stirred for 10 min and then placed under vacuum to remove the volatiles. Extraction of the remaining solid residues with toluene (50 mL), followed by filtration and evaporation, gave the desired product as a beige solid (2.14 g, 81 %). \textsuperscript{1}H NMR (CD\textsubscript{2}Cl\textsubscript{2}, 25 °C): δ 7.64-7.71 (m, 4H, H\textsubscript{Ar}), 7.49-7.57 (m, 10H, H\textsubscript{Ar}), 7.26-7.42 (m, 10H, H\textsubscript{Ar}), 7.03 (m, 2H, H\textsubscript{8} & H\textsubscript{9}). \textsuperscript{13}C NMR (CDCl\textsubscript{3}, 25 °C): δ 157.7 (d, J\textsubscript{CP}= 9.6, C2), 140.4 (d, J\textsubscript{CP}= 17.0, i-C\textsubscript{Ph}), 139.0 (d, J\textsubscript{CP}= 4.5, C6), 135.6 (d, J\textsubscript{CP}= 6.8, C7), 134.1 (d, J\textsubscript{CP}= 20.0, i-C\textsubscript{Ph}), 134.0 (d, J\textsubscript{CP}= 20.7, CH\textsubscript{ar}), 131.4 (d, J\textsubscript{CP}= 7.5, CH\textsubscript{ar}), 130.7 (d, J\textsubscript{CP}= 22.7, CH\textsubscript{ar}), 130.1 (s, CH\textsubscript{ar}), 129.9 (s, CH\textsubscript{ar}), 123.8 (s, CH\textsubscript{ar}), 129.1 (s, CH\textsubscript{ar}), 128.7 (d, J\textsubscript{CP}= 7.5, CH\textsubscript{ar}), 128.6 (d, J\textsubscript{CP}=...

Stirring a mixture of 2 (1.72 g, 3.26 mmol), (i-PrCN)NiBr₂ (1.12 g, 3.91 mmol), and NEt₃ (4.86 mmol, 680 µL) in THF (50 mL) for 2 h at r.t. gave an orange suspension. Evaporation of the volatiles under vacuum, followed by extraction of the solid residues with toluene (75 mL), filtration, and evaporation of the filtrate, gave the crude product as a yellow solid. Slow evaporation of a saturated Et₂O solution of this solid gave analytically pure crystals of the desired product (1.70 g, 78 %). ¹H NMR (CDCl₃, 25 °C): δ 7.93-7.98 (m, 4H, H₁), 7.60-7.65 (m, 5H, H₉), 7.52-7.56 (m, 2H, H₉), 7.42-7.50 (m, 7H, H₁), 7.35-7.39 (m, 4H, H₉), 7.10 (td, JHF = 7.9, JHP = 1.4, 1H, Hₐt), 6.89 (d, JHF = 7.9, 1H, Hₐt), 6.86 (d, JHF = 8.1,

Tetra(ethyl)ammonium chloride (0.22 g, 1.33 mmol) and 4 (0.74 g, 0.89 mmol)
drew dissolved in CH$_3$CN (20 mL) and stirred at 60 $^\circ$C for 24 h. Evaporation of
the solution to dryness followed by purification of the remaining solid residues by
flash chromatography on silica gel (CH$_2$Cl$_2$/hexane) gave a yellow solid that
turned out to be a 1:2 mixture of the desired product and its Ni-Cl analogue,
respectively. Treatment of this mixture with tetra(butyl)ammonium bromide (0.29
g, 0.89 mmol) in CH$_3$CN (10 ml), followed by filtration on silica gel (CH$_2$Cl$_2$),
gave 5 as a yellow solid (0.17 g, 39 %). Recrystallization of the crude product at –
20 $^\circ$C from a THF/pentane mixture gave yellow crystals (m.p. 270-272 $^\circ$C). $^1$H

$^{13}$P NMR (CDCl$_3$, 25 °C): $\delta = +144.9$ ppm. MS (ES): $m/z$: 415.1 [M – Br]$^+$. HRMS (ES): calcd for C$_{22}$H$_{18}$N$_2$OPNi 415.0510; found, 415.0510.

3. Procedure for electrochemical measurements. Cyclic voltammetry measurements were carried out with a potentiostat Autolab PGSTAT100. Experiments were performed at room temperature in an homemade airtight three-electrode cell connected to a vacuum/argon line. The reference electrode consisted of a saturated calomel electrode (SCE) separated from the solution by a bridge compartment. The counter electrode was a platinum wire of ca 1.0 cm$^2$ apparent surface. The working electrode was a glassy carbon microdisk (1.0 mm diameter). Voltammograms were recorded in dry CH$_2$Cl$_2$ solution (ca 3 x 10$^{-3}$ M) in the presence of 0.1 M n-tetrabutylammonium hexafluorophosphate as the supporting electrolyte, under argon at 25°C. In these conditions, the redox couple FeCp$_2^+/FeCp_2$ was found at 0.44 V/SCE. All oxidation potentials reported are referenced to the FeCp$_2^+/FeCp_2$ redox couple.

4. Procedure for crystal structure determinations. Intensity data were collected at 180K on a Bruker Apex2 diffractometer. Structures were solved by direct methods using SIR92$^3$ or SHELXS,$^4$ and refined by full-matrix least-squares procedures using the program CRYSTALS.$^5$ Atomic scattering factors were taken from the International tables for X-ray Crystallography.$^6$ All non-hydrogen atoms
were refined anisotropically. Hydrogen atoms were refined using a riding model. Absorption corrections were introduced using the program MULTISCAN.\(^7\)
